Features

- Operating voltage:2.4-5.2V
- Built-in 32kHz RC oscillator（default）
- External 32.768kHz crystal
- External 32kHz requency source
- 1/4 BIAS
- 1/8 duty (8 COM)
- Built-in 64×8 bit display RAM
- Selection of buzzer frequencies 2kHz、4kHz
- STANDBY mode（by Cmd LCD OFF,SYS DIS）
- 8 kinds of time base/WDT clock sources
- Time base or WDT overflow output （/IRQ pin）
- 3 or 4 wire serial interface
- Software configuration LCD parameters
- Data mode and command mode instructions
- Read/Write address auto increment
- VLCD pin for adjusting LCD operating voltage（<VDD）
- Package:
  LQFP100(14.0mm x 14.0mm PP=0.5mm)
  QFP100(20.0mm x 14.0mm PP=0.65mm)

1 General Description

VK1625 is a RAM Mapping 48x8 LCD Driver， It can support LCD screens with a maximum of 512 pattern(64SEGx8COM).Only 3 or 4 lines are required to communication interface with the VK1625,it is used to configure display parameters and transfer display data, and can also enter the standby mode through Power down command（by Cmd LCD OFF,SYS DIS）.

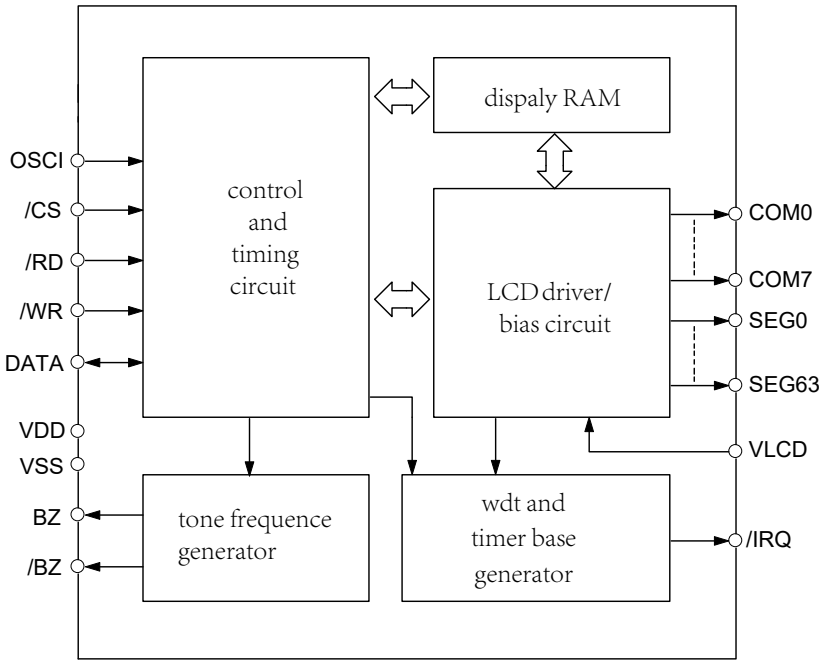
4 Functional Description

4.1 Block diagram



4.2 Display RAM

The static display memory (RAM) is organized into 64×8 bits and stores the displayed data. The contents of the RAM are directly mapped to the contents of the LCD driver. Data in the RAM can be accessed by the READ, WRITE, and READ-MODIFY-WRITE commands.

The following is a mapping from the RAM to the LCD pattern:

	COM7	COM6	COM5	COM4		COM3	COM2	COM1	COM0		
SEG0					1					0	address 7 bit (A6----A0)
SEG1					3					2	
SEG2					5					4	
SEG3					7					6	
⋮					⋮					⋮	
SEG63					127					126	
	D3	D2	D1	D0	Data\Addr	D3	D2	D1	D0	Data\Addr	

4.3 Time Base and WDT

The time base generator is comprised by an 8-stage count-up ripple counter and is designed to generate an accurate time base. The watch dog timer (WDT) is composed of an 8-stage time base generator along with a 2-stage count-up counter,it is designed to break the host controller from abnormal states such as unknown or unwanted jump, execution errors, etc.The WDT time-out will result in the setting of an internal WDT time-out flag. The outputs of the time base generator and of the WDT time-out flag can be connected to the /IRQ pin by a command option. There are totally 8 frequency sources available for the time base generator and the WDT clock. The frequency is calculated by the following equation.

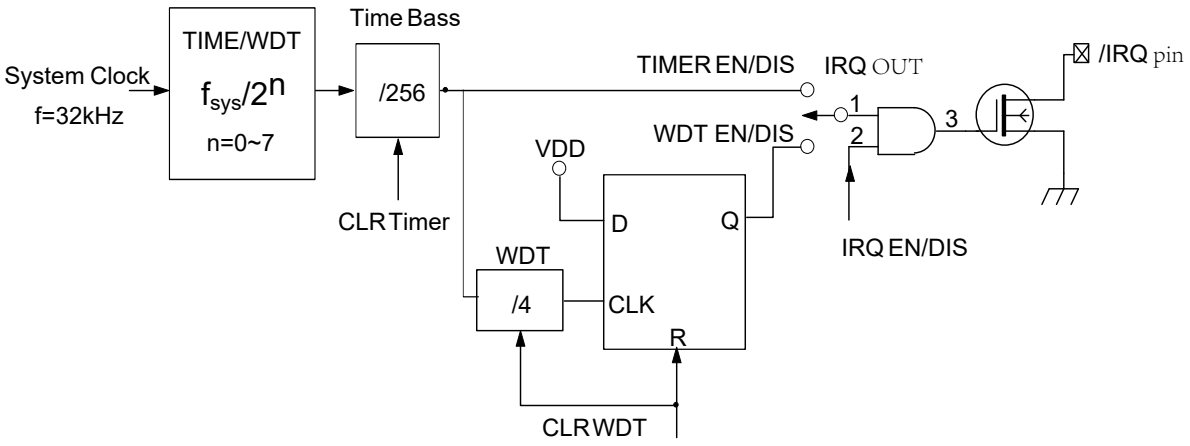
$$f_{WDT}=f_{sys}/2^{n} \quad (n=0\sim7) \qquad fsys=32kHz$$

The time base generator and WDT share the same 8-stage counter.WDT is cleared by executing the CLR WDT command,time base generator is cleared by executing the CLR WDT or the CLR TIMER command.

Executing the WDT EN command not only enables the time base generator but activates the WDT time-out flag output (connect the WDT time-out flag to the /IRQ pin). invoking the WDT DIS command disables the time base generator.After the TIMER EN command is transferred, the WDT is disconnected from the /IRQ pin, and the output of the time base generator is connected to the /IRQ pin.

The /IRQ output can be enabled or disabled by executing the IRQ EN or the IRQ DIS command. After the system power on, the /IRQ will be disabled.

Timer and WDT Configurations:



4.4 Tone Output

VK1625 has a simple 2KHz / 4kHz tone generator， it can output a pair of differential driving signals on the BZ and /BZ, which are used to generate a single tone. By executing the TONE4K and TONE2K commands there are two tone frequency outputs selectable. The tone output can be turned on or off by invoking the TONE ON or the TONE OFF command. The tone outputs, namely BZ and /BZ, are a pair of differential driving outputs used to drive a piezo buzzer. Once the system is disabled or the tone output is inhibited, the BZ and the /BZ outputs will remain at low level.

4.5 LCD Driver

The VK1625 is a 512 (64×8) pattern LCD driver, 1/4bias and 1/8duty (8 com).

4.5.1 Communication Interfacing

Four lines are required to interface with the VK1625.If only used for display, only 3 pins can be used.

The /CS pin is used to initialize the serial interface circuit and to terminate the communication with HOST.

The DATA pin is the serial data input/output line. Data to be read or written or commands to be written have to be passed through the DATA line.

The /RD line is the READ clock input. Data in the RAM are clocked out on the falling edge of the /RD signal, and the clocked out data will then appear on the DATA line.

The /WR line is the WRITE clock input. The data, address, and command on the DATA line are all clocked into theVK1625 on the rising edge of the WR signal.

The /IRQ pin can be selected as a timer output or a WDT overflow flag output by the software setting,it is a NMOS open drain output.

4.5.2 Command Format

VK1625 can be configured by the Software setting. There are two mode commands to configure the LCD parameters and to transfer the LCD display data,The configuration mode of the VK1625 is called command mode, and its command mode ID is 1 0 0. The data mode includes READ, WRITE, and READ-MODIFY-WRITE operations.

The following are the data mode IDs and the command mode ID:

Operation	MODE	ID
READ	DATA	110
WRITE	DATA	101
Read-Modify-Write	DATA	101
