

WCMA1008U1X

128K x 8 Static RAM

Features

- **High Speed**
— 55ns and 70ns availability
- **Voltage range**
— 2.7V–3.6V
- **Ultra low active power**
— Typical active current: 20 mA @ $f = f_{max}$ (70ns speed)
- **Low standby power**
- **Easy memory expansion with \overline{CE} and \overline{OE} features**
- **Automatic power-down when deselected**
- **CMOS for optimum speed/power**

Functional Description

The WCMA1008U1X is a high-performance CMOS static RAM organized as 128K words by 8 bits. Easy memory expansion is provided by an active LOW Chip Enable (\overline{CE}_1), an active HIGH Chip Enable (CE_2), an active LOW Output Enable (\overline{OE}) and three-state drivers. These devices have an automat-

ic power-down feature, reducing the power consumption by over 99% when deselected.

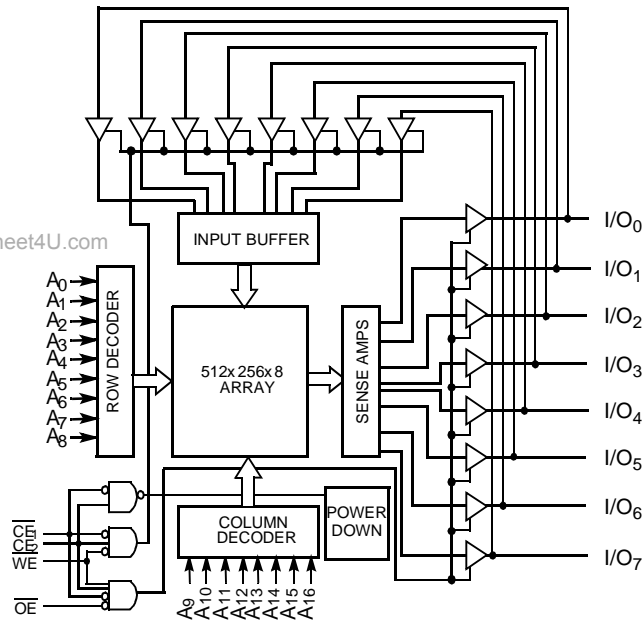

Writing to the device is accomplished by taking Chip Enable one (\overline{CE}_1) and Write Enable (\overline{WE}) inputs LOW and the Chip Enable two (CE_2) input HIGH. Data on the eight I/O pins (I/O_0 through I/O_7) is then written into the location specified on the address pins (A_0 through A_{16}).

Reading from the device is accomplished by taking Chip Enable one (\overline{CE}_1) and Output Enable (\overline{OE}) LOW while forcing Write Enable (\overline{WE}) and Chip Enable two (CE_2) HIGH. Under these conditions, the contents of the memory location specified by the address pins will appear on the I/O pins.

The eight input/output pins (I/O_0 through I/O_7) are placed in a high-impedance state when the device is deselected (\overline{CE}_1 HIGH or CE_2 LOW), the outputs are disabled (\overline{OE} HIGH), or during a write operation (\overline{CE}_1 LOW, CE_2 HIGH, and \overline{WE} LOW).

The WCMA1008U1X is available in a 32 Lead TSOP and STSOP packages.

- Notes:**
5. Test conditions assume signal transition time of 5 ns or less, timing reference levels of $V_{CC(typ.)}/2$, input pulse levels of 0 to $V_{CC(typ.)}$, and output loading of the specified I_{OL}/I_{OH} and 30 pF load capacitance.
 6. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE}, t_{HZOE} is less than t_{LZOE}, and t_{HZWE} is less than t_{LZWE} for any given device.
 7. t_{HZOE}, t_{HZCE}, and t_{HZWE} transitions are measured when the outputs enter a high impedance state.
 8. The internal write time of the memory is defined by the overlap of \overline{WE} , CE₁ = V_{IL} and CE₂ = V_{IH}. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input set-up and hold timing should be referenced to the edge of the signal that terminates the write.

Switching Waveforms

Read Cycle No. 1 (Address Transition Controlled) [9, 10]

Read Cycle No. 2 (\overline{OE} Controlled) [10, 11]

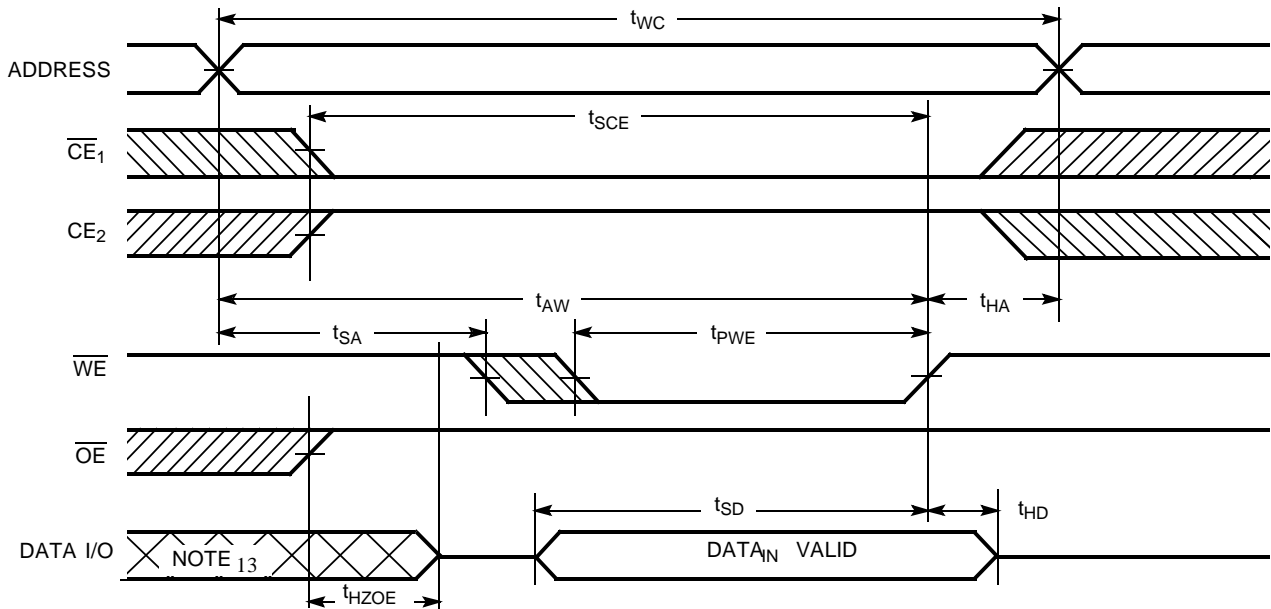

Notes:

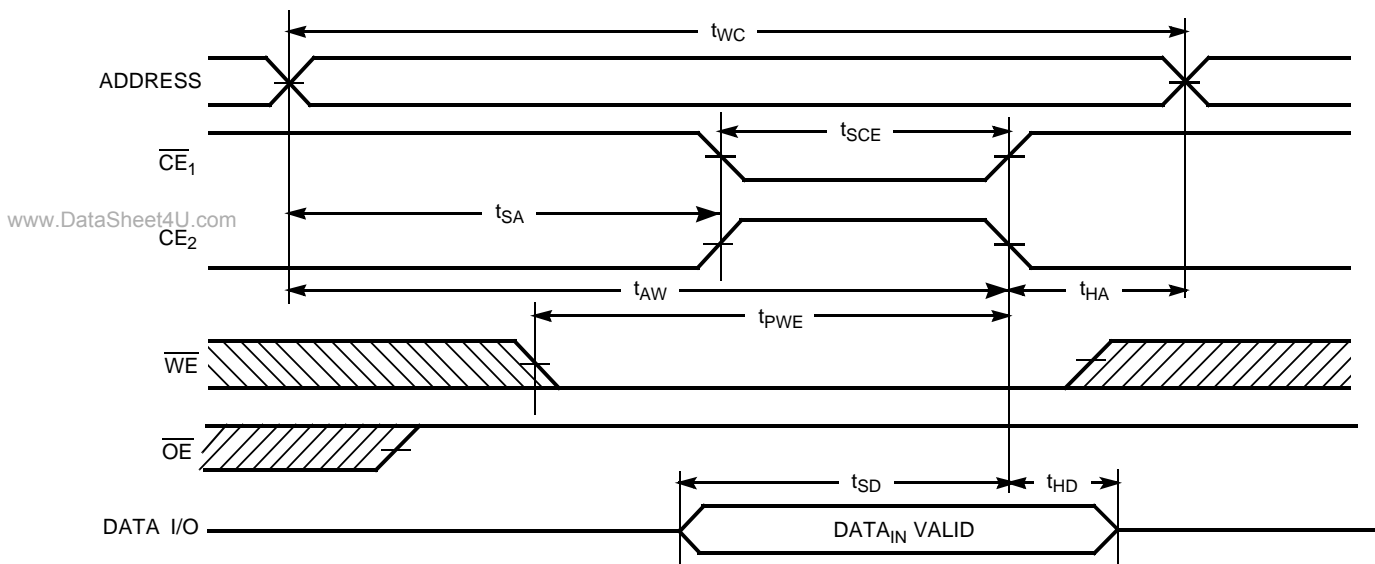

- 9. Device is continuously selected. \overline{OE} , $\overline{CE}_1 = V_{IL}$, $CE_2 = V_{IH}$.
- 10. \overline{WE} is HIGH for read cycle.
- 11. Address valid prior to or coincident with \overline{CE}_1 transition LOW and CE_2 transition HIGH.

Switching Waveforms (continued)

Write Cycle No. 1 (\overline{WE} Controlled) [8, 12, 14]

Write Cycle No. 2 (\overline{CE}_1 or \overline{CE}_2 Controlled) [8, 12, 14]

Notes:

- 12. Data I/O is high impedance if $\overline{OE} = V_{IH}$.
- 13. During this period, the I/Os are in output state and input signals should not be applied.
- 14. If \overline{CE}_1 goes HIGH and \overline{CE}_2 goes LOW simultaneously with WE HIGH, the output remains in a high-impedance state.
