2. Precautions in Use of LCD Module

- (1) Avoid applying excessive shocks to the module or making any alterations or modifications to it.
- (2) Don't make extra holes on the printed circuit board, modify its shape or change the components of LCD Module.
- (3) Don't disassemble the LCM.
- (4) Don't operate it above the absolute maximum rating.
- (5) Don't drop, bend or twist LCM.
- (6) Soldering : only to the I/O terminals.
- (7) Storage : please storage in anti-static electricity container and clean environment.
- (8) Winstar have the right to change the passive components
(Resistors, capacitors and other passive components will have different appearance and color caused by the different supplier.)
- (9) Winstar have the right to change the PCB Rev.

10. Function Description

◆ Block Diagram

This 122x32 dots LCD Module built in two SBN1661G_M18-D LSI controller.

◆ MPU interface

The SBN1661G_M18-D controller transfers data via 8-bit bidirectional data buses (D0 to D7), it can fit any MPU if it corresponds to SBN1661G_M18-D Read and Write Timing Characteristics.

◆ Data transfer

The SBN1661G_M18-D driver uses the A0, E and R/W signals to transfer data between the system MPU and internal registers, The combinations used are given in the table below.

| A0 | R/W | Function |
|----|-----|--------------------------------------|
| 1 | 1 | Read display data |
| 1 | 0 | Write display data |
| 0 | 1 | Read status |
| 0 | 0 | Write to internal register (command) |

◆ **Busy flag**

When the Busy flag is logical 1, the SBN1661G_M18-D series is executing its internal operations. Any command other than Status Read is rejected during this time. The Busy flag is output at pin D7 by the Status Read command. If an appropriate cycle time (t_{CYC}) is given, this flag needs not be checked at the beginning of each command and, therefore, the MPU processing capacity can greatly be enhanced.

◆ **Display Start Line and Line Count Registers**

The contents of this register form a pointer to a line of data in display data RAM corresponding to the first line of the display (COM0), and are set by the Display Start Line command.

◆ **Column Address Counter**

The column address counter is a 7-bit presettable counter that supplies the column address for MPU access to the display data RAM. See Figure 1. The counter is incremented by one every time the driver receives a Read or Write Display Data command. Addresses above 50H are invalid, and the counter will not increment past this value. The contents of the column address counter are set with the Set Column Address command.

◆ **Display Data RAM**

The display data RAM stores the LCD display data, on a 1-bit per pixel basis. The relationship between display data, display address and the display is shown in Figure 1.

◆ **Page Register**

The page register is a 2-bit register that supplies the page address for MPU access to the display data RAM. See Figure 1. The contents of the page register are set by the Set Page Register command.

11. Commands Descriptions

The host microcontroller can issue commands to the SBN1661G_X. Table 27 lists all the commands.

When issuing a command, the host microcontroller should put the command code on the data bus. The host microcontroller should also give the control bus C/D, E(RD), and R/W(WR) proper value and timing.

Commands

| COMMAND | COMMAND CODE | | | | | | | | FUNCTION |
|--------------------|--|----|----|----|----|----|----|----|---|
| | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | |
| Write Display Data | Data to be written into the Display Data Memory. | | | | | | | | Write a byte of data to the Display Data Memory. |
| Read Display Data | Data read from the Display Data Memory. | | | | | | | | Read a byte of data from the Display Data Memory. |
| Read-Modify-Write | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | Start Read-Modify-Write operation. |
| END | 1 | 1 | 1 | 0 | 1 | 1 | 1 | 0 | Stop Read-Modify-Write operation. |
| Software Reset | 1 | 1 | 1 | 0 | 0 | 0 | 1 | 0 | Software Reset. |

Write Display Data

The Write Display Data command writes a byte (8 bits) of data to the Display Data Memory. Data is put on the data bus by the host microcontroller. The location which accepts this byte of data is pointed to by the Page Address Register and the Column Address Register. At the end of the command operation, the content of the Column Address Register is automatically incremented by 1.

| $\overline{C/D}$ | $E/(\overline{RD})$ | $R/\overline{W}(\overline{WR})$ |
|------------------|---------------------|---------------------------------|
| 1 | 1 | 0 |

Read Display Data

The Read Display Data command starts a 3-step operation.

1. First, the current data of the internal 8-bit output latch of the Display Data Memory is read by the microcontroller, via the 8-bit data bus DB0~DB7.
2. Then, a byte of data of the Display Data Memory is transferred to the 8-bit output latch from a location specified by the Page Address Register and the Column Address Register,
3. Finally, the content of the Column Address Register is automatically incremented by one. Fig. 16 shows the internal 8-bit output latch located between the 8-bit I/O data bus and the Display Data Memory cell array. Because of this internal 8-bit output latch, a dummy read is needed to obtain correct data from the Display Data Memory. For Display Data Write operation, a dummy write **is not** needed,

because data can be directly written from the data bus to internal memory cells.

The setting of the control bus for issuing Read Display Data command

| \overline{C}/D | $E/(\overline{RD})$ | $R/\overline{W}(\overline{WR})$ |
|------------------|---------------------|---------------------------------|
| 1 | 0 | 1 |

Read-Modify-Write

When the Read-Modify-Write command is issued, the SBN1661G_X enters into Read-Modify-Write mode. In normal operation, when a Read Display Data command or a Write Display Data command is issued, the content of the Column Address Register is automatically incremented by one after the command operation is finished. However, during Read-Modify-Write mode, the content of the Column Address Register is not incremented by one after a Read Display Data command is finished; only the Write Display Data command can make the content of the Column Address Register automatically incremented by one after the command operation is finished.

During Read-Modify-Write mode, any other registers, except the Column Address Register, can be modified. This command is useful when a block of the Display Data Memory needs to be repeatedly

read and updated.

Fig. 17 gives the change sequence of the Column Address Register during Read-Modify-Write mode.

Figure 18 gives the flow chart for Read-Modify-Write command.

The command code is EE Hex.

Software RESET command

The Software Reset command is different from the hardware reset and can not be used to replace hardware reset.

When Software Reset is issued by the host microcontroller,

- the content of the Display Start Line Register is cleared to zero(A4~A0=00000),
- the Page Address Register is set to 3 (A1 A0 = 11),
- the content of the Display Data Memory remains unchanged.
- the content of all other registers remains unchanged.

15. Material List of Components for RoHs

1. WINSTAR Display Co., Ltd hereby declares that all of or part of products (with the mark “#”in code), including, but not limited to, the LCM, accessories or packages, manufactured and/or delivered to your company (including your subsidiaries and affiliated company) directly or indirectly by our company (including our subsidiaries or affiliated companies) do not intentionally contain any of the substances listed in all applicable EU directives and regulations, including the following substances.

Exhibit A : The Harmful Material List

| Material | (Cd) | (Pb) | (Hg) | (Cr6+) | PBBs | PBDEs |
|--|---------|----------|----------|----------|----------|----------|
| Limited Value | 100 ppm | 1000 ppm | 1000 ppm | 1000 ppm | 1000 ppm | 1000 ppm |
| Above limited value is set up according to RoHS. | | | | | | |

2.Process for RoHS requirement :

(1) Use the Sn/Ag/Cu soldering surface ; the surface of Pb-free solder is rougher than we used before.

(2) Heat-resistance temp. :

Reflow : 250°C,30 seconds Max. ;

Connector soldering wave or hand soldering : 320°C, 10 seconds max.

(3) Temp. curve of reflow, max. Temp. : 235±5°C ;

Recommended customer’s soldering temp. of connector : 280°C, 3 seconds.

16. Storage

1. Place the panel or module in the temperature 25°C±5°C and the humidity below 65% RH
2. Do not place the module near organics solvents or corrosive gases.
3. Do not crush, shake, or jolt the module.
