

Features

- Low Power Consumption: 70uA (Typ)
- Maximum Output Current: 300mA
- Small Dropout Voltage
130mV@100mA (Vout=3.3V)
- PSRR=70dB@1KHz
- Input Voltage Range: 2.0V~6.5V
- Output Voltage Range: 1.2V~3.6V
(customized on command in 0.1V steps)
- Standby Current : less than 1μA
- High Accurate: ±2%
- Good Transient Response
- Over-Temperature Protection
- Support Fixed Output Voltage
- Output Current Limit
- Stable with Ceramic Capacitor
- Available Package
SOT23-3 \ SOT23-5 \ SOT89-3 \ SC70-5
- RoHS Compliant and Lead (Pb) Free

Application

- Portable, Battery Powered Equipment
- Audio/Video Equipment
- Power Management of MP3. PDA.....
- Weighting Scales. Home Automation

Description

The WL9003 series are highly precise, low noise, positive voltage LDO regulators manufactured using CMOS processes. The series achieves high ripple rejection and low dropout and consists of a standard voltage source, an error correction, current limiter and a phase compensation circuit plus a driver transistor. Output voltage is selectable in 0.1V increments within a range of 1.2V ~ 3.6V. The series is also compatible with low ESR ceramic capacitors which give added output stability. This stability can be maintained even during load fluctuations due to the excellent transient response of the series. The limiter's feedback circuit also operates as a protect for the output current limiter The CE function enables the output to be turned off, resulting in greatly reduced power consumption. The WL9003 consumes less than 1μA in shutdown mode and has fast turn-on time less than 50s. The other features include ultra low dropout voltage, high output accuracy, current limiting protection, and high ripple rejection ratio.

Application Guideline

Input Capacitor

A 1 μ F ceramic capacitor is recommended to connect between V_{DD} and GND pins to decouple input power supply glitch and noise. The amount of the capacitance may be increased without limit. This input capacitor must be located as close as possible to the device to assure input stability and less noise. For PCB layout, a wide copper trace is required for both VIN and GND.

Output Capacitor

An output capacitor is required for the stability of the LDO. The recommended output capacitance is 1 μ F, ceramic capacitor is recommended, and temperature characteristics are X7R or X5R. Higher capacitance values help to improve load/line transient response. The output capacitance may be increased to keep low undershoot/overshoot. Place output capacitor as close as possible to VOUT and GND pins.

Dropout Voltage

The dropout voltage refers to the voltage difference between the VIN and VOUT pins while operating at specific output current. The dropout voltage V_{DROP} also can be expressed as the voltage drop on

the pass-FET at specific output current (I_{RATED}) while the pass-FET is fully operating at ohmic region and the pass-FET can be characterized as a resistance $R_{DS(ON)}$. Thus the dropout voltage can be defined as ($V_{DROP} = V_{IN} - V_{OUT} = R_{DS(ON)} \times I_{RATED}$). For normal operation, the suggested LDO operating range is ($V_{IN} > V_{OUT} + V_{DROP}$) for good transient response and PSRR ability. Vice versa, while operating at the ohmic region will degrade the performance severely.

Thermal Application

For continuous operation, do not exceed the absolute maximum junction temperature. The maximum power dissipation depends on the thermal resistance of the IC package, PCB layout, rate of surrounding airflow, and difference between junction and ambient temperature. The maximum power dissipation can be calculated as below: $T_A = 25^\circ\text{C}$, PCB,

The max PD = $(125^\circ\text{C} - 25^\circ\text{C}) / (\text{Thermal Resistance } ^\circ\text{C/W})$

Power dissipation (PD) is equal to the product of the output current and the voltage drop across the output pass element, as shown in the equation below:

$$PD = (V_{IN} - V_{OUT}) \times I_{OUT}$$

Layout Consideration

By placing input and output capacitors on the same side of the PCB as the LDO, and placing them as close as is practical to the package can achieve the best performance. The ground connections for input and output capacitors must be back to the WL9003 ground pin using as wide and as short of a copper trace as is practical. Connections using long trace lengths, narrow trace widths, and/or connections through via must be avoided. These add parasitic inductances and resistance that results in worse performance especially during transient conditions.
