## XE0002B

### DAA with 2/4 Wire Hybrid

#### Description

The XE0002B Data Access Arrangement provides a 'direct connect' telephone line interface. It complies with FCC Part 68 hazardous voltage, surge and leakage current specifications. This component may be used as the direct connect telephone line interface for virtually any application in which voice or data is to be transmitted over the public switched telephone network.

The XE0002B provides high voltage isolation, independent on/off hook control, ring detection circuitry and a 2 to 4 wire converter hybrid for use in modem applications. It operated from  $\pm 5$  volt power supplies and occupies 1.25 square inches of board space.

#### Features

- Small Size - 1.25" x 1.0" x 0.5"
- FCC Part 68 Compliant
- Ring Detection
- 2 to 4 Wire Converter
- 1500 Volt Isolation
- 800 Volt Surge Protection
- Hookswitch Control

#### PIN CONFIGURATION

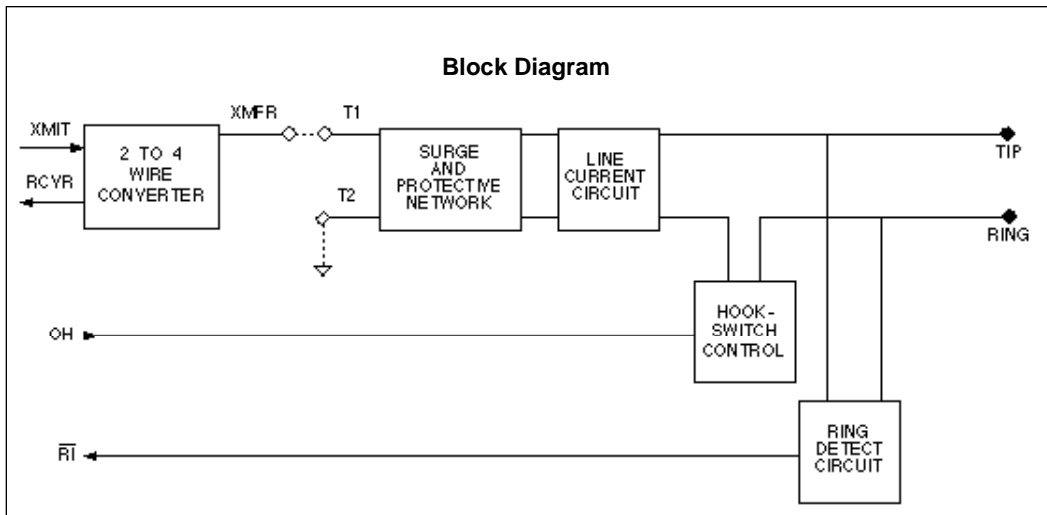

Pin	Signal	Pin	Signal
1	VDD	20	TIP
2	VCC		
3	RI		
4	RCVR	17	RING
5	XMIT		
6	XMFR		
7	T1	14	N/C
8	OH	13	N/C
9	GND	12	N/C
10	T2	11	N/C

(Top View)

#### CAUTION

PINS 17 & 20 HAVE 1500V ISOLATION FROM THE REST OF THE CIRCUITRY. THIS ISOLATION SHOULD BE PRESERVED THROUGHOUT THE SYSTEM

#### Block Diagram

# Pin Descriptions

PIN	NAME	I/O	DESCRIPTION
1	VDD	---	-5 Volts.
2	VCC	---	+5 Volts
3	\RI	O	Ring Indicator, output, active LO, TTL. When low indicates the modem is receiving a ring signal.
4	RCVR	O	Analog signal output from the 2-4 wire convertor.
5	XMIT	I	Analog signal input to the 2-4 wire convertor.
6	XMFR	I	Analog input/output from the Surge and Protective Network to the internal 2-4 wire convertor. Must be tied to pin 7, T1, to use the internal 2-4 wire convertor.
7	T1	I	Analog Signal input/output to the Surge and Protective network.
8	OH	I	Off-Hook controls the hookswitch relay within the XE0002B. A high on OH closes the internal relay and connects the equipment to the telephone line.
9	GND	---	Ground.
10	T2	I	Analog Signal input/output to the Surge and Protective network.
17	RING	---	Ring connection to the phone line (RJ11 pin4) from the internal DAA.
20	TIP	---	Tip connection to the phone line (RJ11 pin3) from the internal DAA.

# Telephone Line Connection Information

When developing a product that is to be connected to the telephone line, it is necessary to use a circuit described as a Data Access Arrangement (DAA) which is approved by the appropriate governmental agency. In the US, for example, this agency is the Federal Communications Commission (FCC), while in Canada it is the Department of Communications (DOC). These agencies test and approve the product to ensure that it meets their specifications, thereby protecting the telephone system from damage and protecting the user from high voltage transients (such as lightning strikes) which may come down the telephone line.

The XE0002B has been designed to meet all FCC Part 68 requirements for hazardous voltage, surge protection and leakage current. If the system developed transmits data, or DTMF tones on the telephone line, the user must certify that the signals transmitted from the XE0002B meet basic FCC requirements for maximum transmission levels of out of band energy and billing delay. Full details may be obtained from the FCC under Part 68 of the FCC Rules and Regulations, or in Title 47 of the Code of Federal Regulations, however the basic requirements are as follows:

## 1. Maximum Transmit Level

For the normal "permissive" (standard) telephone line, equipment which transmits data (such as a modem) must not exceed a transmission level of -9 dBm.

## 2. Out of Band Energy

Data equipment must not transmit "out of band" energy on the telephone line which exceeds the following limits:

Frequency		Range	Max. Power
200Hz	to	3990Hz	-9 dBm
3990Hz	to	4005Hz	-27 dBm
4005Hz	to	16kHz	-16 dBm
8kHz	to	94kHz	-47 dBm
86kHz	to	270kHz	-46 dBm
270kHz	to	6MHz	-6 dBm

For modem applications, the out of band energy limit is normally ensured by the transmit filter in the modem circuitry.

## 3. DTMF Transmission Level

If the system is capable of DTMF dialing, the maximum DTMF transmission level must be less than 0 dBm averaged over a 3 second interval.

## 4. Billing Delay

A delay of 2 seconds or greater is required after the time the XE0002B is taken "off hook" and before any data is transmitted. This is required to ensure that billing information may be exchanged between telephone company central offices without interference.

The user of the XE0002B must certify to the FCC that the final system meets the requirements of Part 68 which include the criteria above as well as the high voltage protection that is provided by the XE0002B. This is generally accomplished through an independent testing lab which will test the System and submits the proper paperwork to the FCC for approval. Since the XE0002B already complies with FCC Part 68 rules, this is a relatively simple process.
