

XR76203-Q/XR76205-Q/XR76208-Q

AEC-Q100 Qualified 40V PowerBlox™

3A/5A/8A Synchronous Step Down COT Regulator

General Description

The XR76203-Q, XR76205-Q and XR76208-Q are synchronous step-down regulators combining the controller, drivers, bootstrap diode and MOSFETs in a single package for point-of-load supplies well suited for automotive applications. Qualified per AEC-Q100, the XR76203-Q, XR76205-Q and XR76208-Q have load current ratings of 3A, 5A and 8A respectively. A wide 5.5V to 40V input voltage range allows for single supply operation from 12V battery systems required to withstand load dump, industry standard 24V ±10%, 18V-36V, and rectified 18VAC and 24VAC rails.

With a proprietary emulated current mode Constant On-Time (COT) control scheme, the XR76203-Q, XR76205-Q and XR76208-Q provide extremely fast line and load transient response using ceramic output capacitors. They require no loop compensation, simplifying circuit implementation and reducing overall component count. The control loop also provides 0.07% load and 0.15% line regulation and maintains constant operating frequency. A selectable power saving mode allows the user to operate in discontinuous conduction mode (DCM) at light current loads thereby significantly increasing the converter efficiency.

A host of protection features, including over-current, over-temperature, short-circuit and UVLO, helps achieve safe operation under abnormal operating conditions.

The XR76203/5/8-Q are available in a RoHS-compliant, green/halogen-free space-saving QFN 5x5mm package.

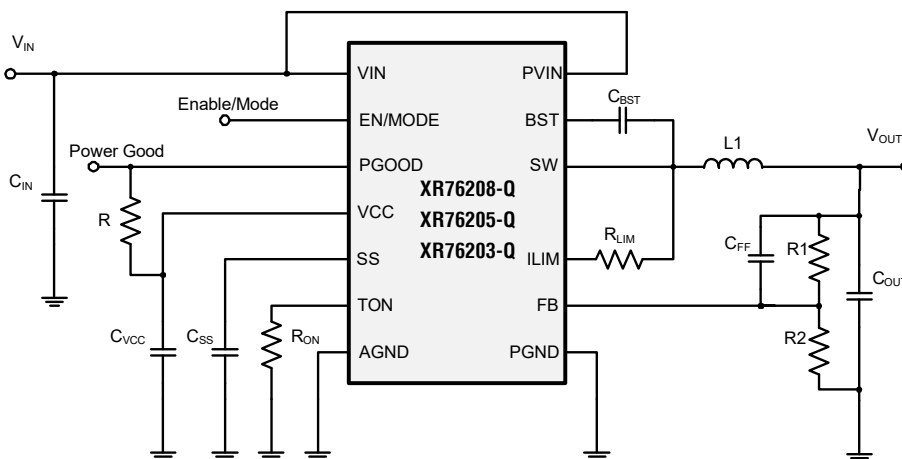

FEATURES

- Automotive AEC-Q100 Qualified
 - Temperature Grade 1: -40°C to 125°C
 - HBM ESD Class Level 2
 - CDM ESD Class Level C4B
- Controller, drivers, bootstrap diode and MOSFETs integrated in one package
- 3A, 5A and 8A Step Down Regulators
 - Wide 5.5V to 40V Input Voltage Range
 - ≥0.6V Adjustable Output Voltage
- Proprietary Constant On-Time Control
 - No Loop Compensation Required
 - Stable Ceramic Output Capacitor Operation
 - Programmable 200ns to 2µs On-Time
 - Constant 100kHz to 800kHz Frequency
- Selectable CCM or CCM/DCM
 - CCM/DCM for high efficiency at light-load
 - CCM for constant frequency at light-load
- Programmable Hiccup Current Limit with Thermal Compensation
- Precision Enable and Power Good flag
- Programmable Soft-start
- 30-pin 5x5mm QFN package with wettable flanks

APPLICATIONS

- Automotive Systems
- Distributed Power Architecture
- Point-of-Load Converters
- Power Supply Modules
- FPGA, DSP, and Processor Supplies
- Industrial and Military

Typical Application

Ordering Information - [Back Page](#)

Absolute Maximum Ratings

Stresses beyond the limits listed below may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Pin Configuration, Top View

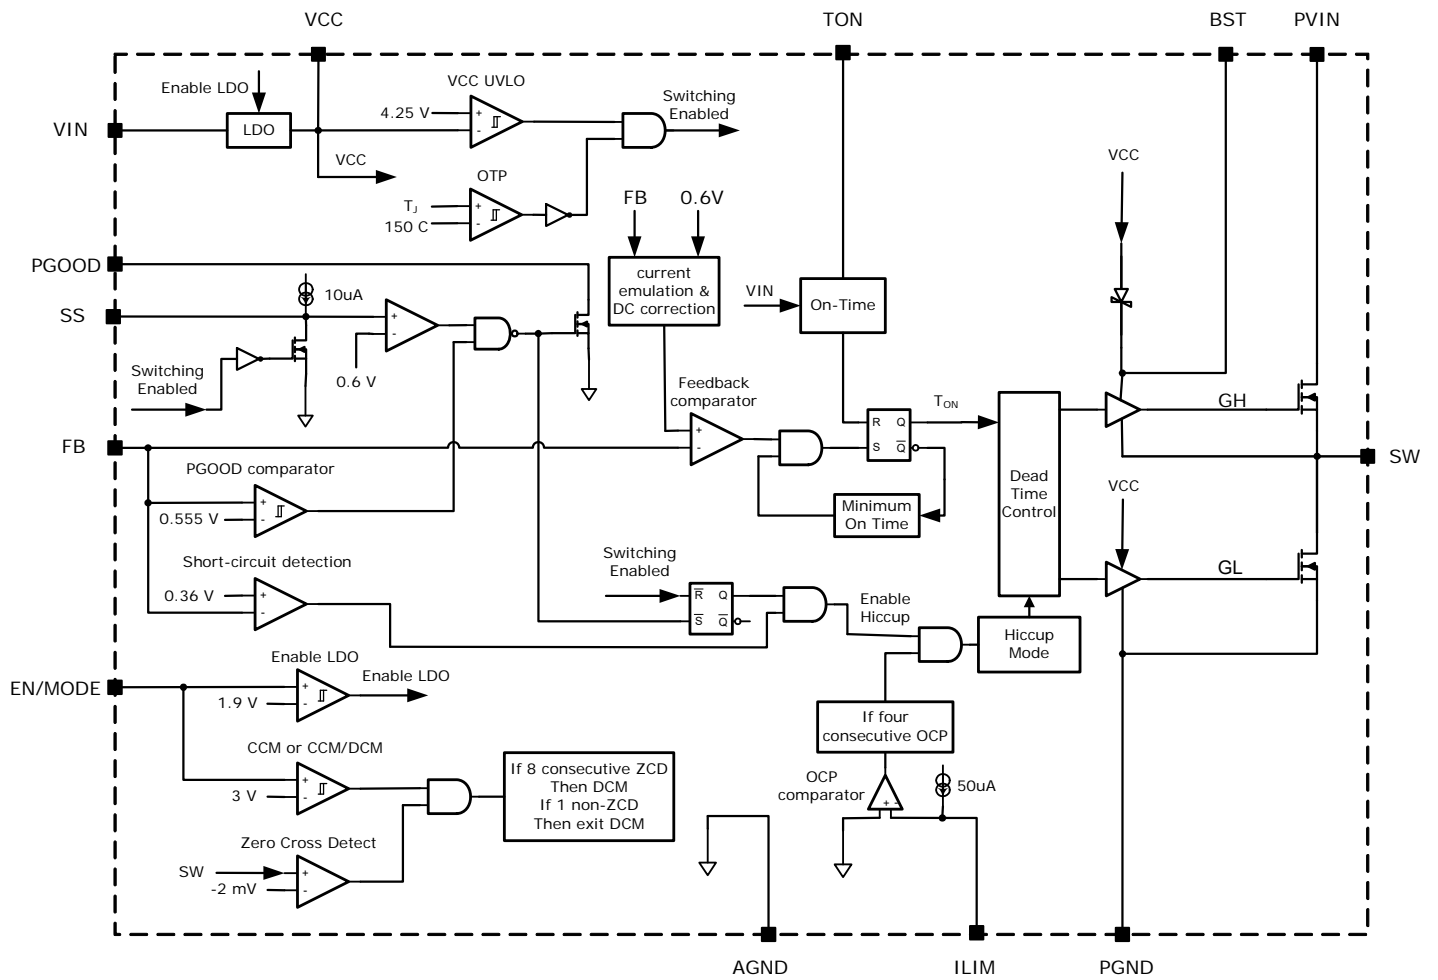

Pin Assignments

Pin No.	Pin Name	Type	Description
1	ILIM	A	Over-current protection programming. Connect with a resistor to SW.
2	EN/MODE	I	Precision enable pin. Pulling this pin above 1.9V will turn the regulator on and it will operate in CCM. If the voltage is raised above 3.0V then the regulator will operate in DCM/CCM depending on load
3	TON	A	Constant on-time programming pin. Connect with a resistor to AGND.
4	SS	A	Soft-Start pin. Connect an external capacitor between SS and AGND to program the soft-start rate based on the 10uA internal source current.
5	PGOOD	O, OD	Power-good output. This open-drain output is pulled low when V_{OUT} is outside the regulation.
6	FB	A	Feedback input to feedback comparator. Connect with a set of resistors to VOUT and AGND in order to program V_{OUT} .
7, 10, AGND Pad	AGND	A	Signal ground for control circuitry. Connect AGND Pad with a short trace to pins 7 and 10.
8	VIN	A	Supply input for the regulator's LDO. Normally it is connected to PVIN.
9	VCC	A	The output of regulator's LDO. For operation using a 5V rail, VCC should be shorted to VIN.
11-14, 20, 29, SW Pad	SW	PWR	Switch node. Drain of the low-side N-channel MOSFET. Source of the high-side MOSFET is wire-bonded to the SW Pad. Pins 20 and 29 are internally connected to SW pad.
15-19, PGND Pad	PGND	PWR	Ground of the power stage. Should be connected to the system's power ground plane. Source of the low-side MOSFET is wire-bonded to PGND Pad.
21-28, PVIN Pad	PVIN	PWR	Input voltage for power stage. Drain of the high-side N-channel MOSFET.
30	BST	A	High-side driver supply pin. Connect a bootstrap capacitor between BST and pin 29.

Type: A = Analog, I = Input, O = Output, I/O = Input/Output, PWR = Power, OD = Open-Drain

Functional Description

XR76203-Q, XR76205-Q and XR76208-Q are synchronous step-down proprietary emulated current-mode Constant On-Time (COT) regulators. The on-time, which is programmed via R_{ON} , is inversely proportional to V_{IN} and maintains a nearly constant frequency. The emulated current-mode control is stable with ceramic output capacitors.

Each switching cycle begins with GH signal turning on the high-side (control) FET for a preprogrammed time. At the end of the on-time, the high-side FET is turned off and the low-side (synchronous) FET is turned on for a preset minimum time (250ns nominal). This parameter is termed Minimum Off-Time. After the minimum off-time, the voltage at the feedback pin FB is compared to an internal voltage ramp at the feedback comparator. When V_{FB} drops below the ramp voltage, the high-side FET is turned on and the cycle repeats. This voltage ramp constitutes an emulated current ramp and makes possible the use of ceramic capacitors, in addition to other capacitor types, for output filtering.

Enable/Mode Input (EN/MODE)

EN/MODE pin accepts a tri-level signal that is used to control turn on/off. It also selects between two modes of operation: 'Forced CCM' and 'DCM/CCM'. If EN is pulled below 1.8V, the Regulator shuts down. A voltage between 2.0V and 2.8V selects the Forced CCM mode which will run the Regulator in continuous conduction at all times. A voltage higher than 3.1V selects the DCM/CCM mode which will run the Regulator in discontinuous conduction at light loads.

Selecting the Forced CCM Mode

In order to set the Regulator to operate in Forced CCM, a voltage between 2.0V and 2.8V must be applied to EN/MODE. This can be achieved with an external control signal that meets the above voltage requirement. Where an external control is not available, the EN/MODE can be derived from V_{IN} . If V_{IN} is well regulated, use a resistor divider and set the voltage to 2.5V. If V_{IN} varies over a wide range, the circuit shown in figure 31 can be used to generate the required voltage. Note that at V_{IN} of 5.5V and 40V the nominal Zener voltage is 4.0V and 5.0V respectively. Therefore for V_{IN} in the range of 5.5V to 40V, the circuit shown in figure 31 will generate V_{EN} required for Forced CCM.

Selecting the DCM/CCM Mode

In order to set the Regulator operation to DCM/CCM, a voltage between 3.1V and 5.5V must be applied to EN/MODE pin. If an external control signal is available, it can be directly connected to EN/MODE. In applications where an

external control is not available, EN/MODE input can be derived from V_{IN} . If V_{IN} is well regulated, use a resistor divider and set the voltage to 4V. If V_{IN} varies over a wide range, the circuit shown in figure 32 can be used to generate the required voltage.

Figure 31: Selecting Forced CCM by deriving EN/MODE from V_{IN}

Figure 32: Selecting DCM/CCM by deriving EN/MODE from V_{IN}

Programming the On-Time

The On-Time T_{ON} is programmed via resistor R_{ON} according to following equation:

$$R_{ON} = \frac{V_{IN} \times [T_{ON} - (25 \times 10^{-9})]}{3.05 \times 10^{-10}}$$

where T_{ON} is calculated from:

$$T_{ON} = \frac{V_{OUT}}{V_{IN} \times f \times Eff}$$

where:

f is the desired switching frequency at nominal I_{OUT}

Eff is the Regulator efficiency corresponding to nominal I_{OUT} shown in figures 19-24

Substituting for T_{ON} in the first equation we get:

$$R_{ON} = \frac{\left(\frac{V_{OUT}}{f \times Eff}\right) - [(25 \times 10^{-9}) \times V_{IN}]}{3.05 \times 10^{-10}}$$

Over-Current Protection (OCP)

If load current exceeds the programmed over-current, I_{OCP} for four consecutive switching cycles, the Module enters hiccup mode of operation. In hiccup, the MOSFET gates are turned off for 110ms (hiccup timeout). Following the hiccup timeout, a soft-start is attempted. If OCP persists, hiccup timeout will repeat. The Module will remain in hiccup mode until load current is reduced below the programmed I_{OCP} . In order to program the over-current protection, use the following equation:

$$RLIM = \frac{(I_{OCP} \times RDS) + 8mV}{ILIM}$$

Where:

$RLIM$ is resistor value for programming I_{OCP}

I_{OCP} is the over-current threshold to be programmed

RDS is the MOSFET rated On Resistance; XR76208-Q=21.5mΩ, XR76205-Q=59mΩ, XR76203-Q=59mΩ

8mV is the OCP comparator maximum offset

$ILIM$ is the internal current that generates the necessary OCP comparator threshold (use 45μA).

Note that $ILIM$ has a positive temperature coefficient of 0.4%/°C (figure 10). This is meant to roughly match and compensate for positive temperature coefficient of the synchronous FET. Graph of typical I_{OCP} versus $RLIM$ is shown in figure 7-9. Maximum allowable $RLIM$ for XR76205-Q is 8.06kΩ.

Short-Circuit Protection (SCP)

If the output voltage drops below 60% of its programmed value, the Module will enter hiccup mode. Hiccup will persist until short-circuit is removed. SCP circuit becomes active after PGOOD asserts high.

Over-Temperature (OTP)

OTP triggers at a nominal die temperature of 150°C. The gate of switching FET and synchronous FET are turned off. When die temperature cools down to 135°C, soft-start is initiated and operation resumes.

Programming the Output Voltage

Use an external voltage divider as shown in the Application Circuit to program the output voltage V_{OUT} .

$$R1 = R2 \times \left(\frac{V_{OUT}}{0.6} - 1\right)$$

where $R2$ has a nominal value of 2kΩ.

Programming the Soft-start

Place a capacitor CSS between the SS and AGND pins to program the soft-start. In order to program a soft-start time of TSS , calculate the required capacitance CSS from the following equation:

$$CSS = TSS \times \left(\frac{10\mu A}{0.6V}\right)$$

Feed-Forward Capacitor (C_{FF})

A feed-forward capacitor (C_{FF}) may be necessary depending on the Equivalent Series Resistance (ESR) of C_{OUT} . If only ceramic output capacitors are used for C_{OUT} then a C_{FF} is necessary. Calculate C_{FF} from:

$$C_{FF} = \frac{1}{2 \times \pi \times R1 \times 7 \times f_{LC}}$$

where:

$R1$ is the resistor that C_{FF} is placed in parallel with

f_{LC} is the frequency of output filter double-pole

f_{LC} frequency must be less than 11kHz when using ceramic C_{OUT} . If necessary, increase L and/or C_{OUT} in order to meet this constraint.

When using capacitors with higher ESR, such as PANASONIC TPE series, a C_{FF} is not required provided following conditions are met:

1. The frequency of output filter LC double-pole f_{LC} should be less than 11kHz.
2. The frequency of ESR Zero $f_{Zero,ESR}$ should be at least five times larger than f_{LC} .

Note that if $f_{Zero,ESR}$ is less than $5 \times f_{LC}$, then it is recommended to set the f_{LC} at less than 2kHz. C_{FF} is still not required.

Maximum Allowable Voltage Ripple at FB pin

Note that the steady-state voltage ripple at feedback pin FB ($V_{FB,RIPPLE}$) must not exceed 50mV in order for the Regulator to function correctly. If $V_{FB,RIPPLE}$ is larger than 50mV then C_{OUT} should be increased as necessary in order to keep the $V_{FB,RIPPLE}$ below 50mV.

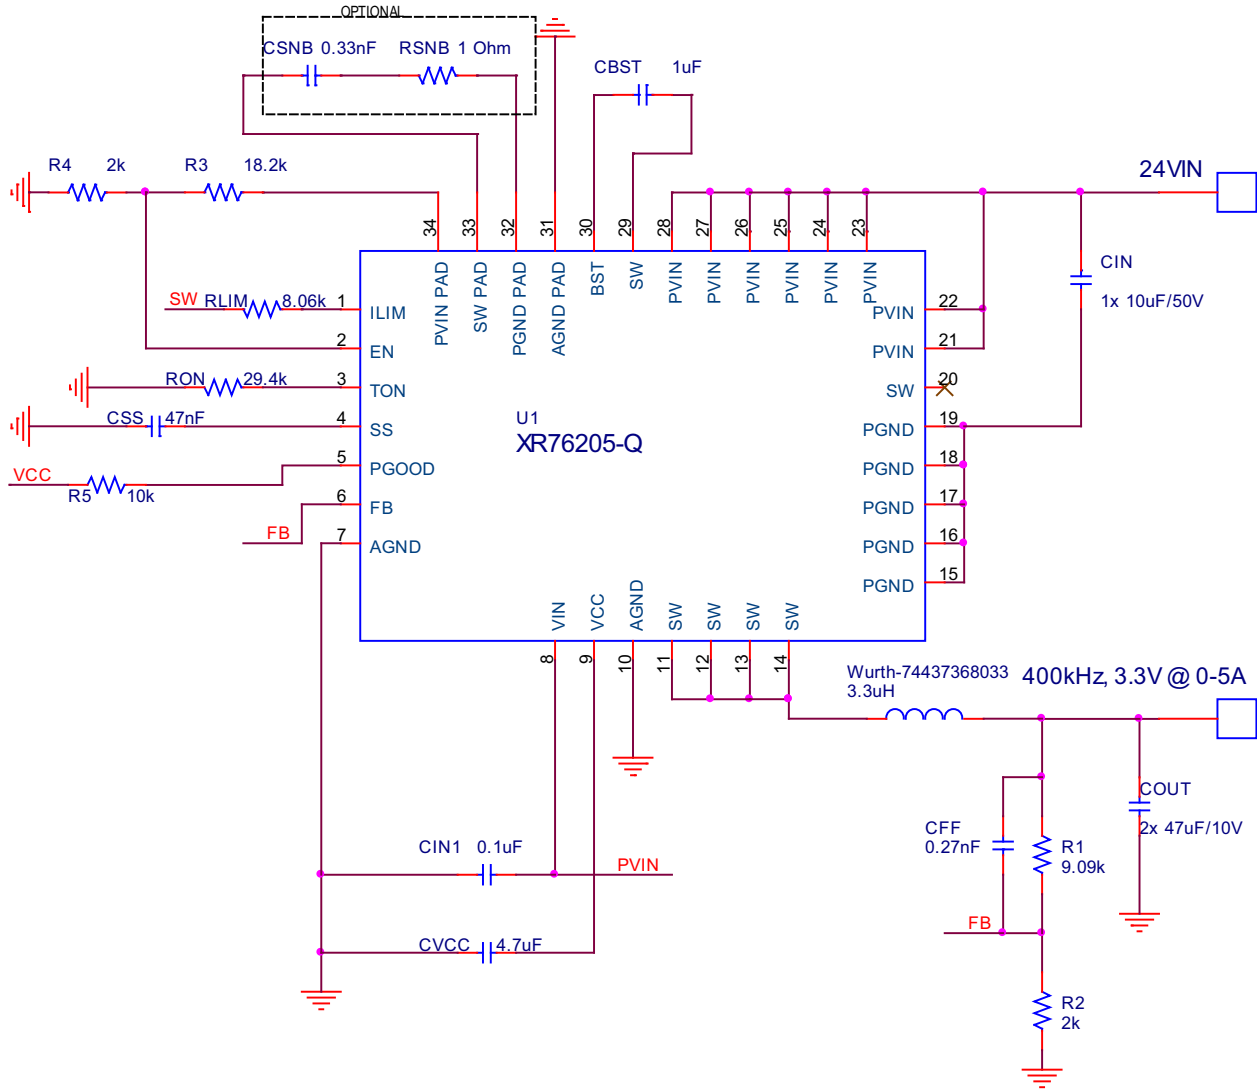

Feed-Forward Resistor (R_{FF})

Poor PCB layout can cause FET switching noise at the output and may couple to the FB pin via C_{FF} . Excessive noise at FB will cause poor load regulation. To solve this problem place a resistor R_{FF} in series with C_{FF} . R_{FF} value up to 2% of $R1$ is acceptable.
