

sinclair

ZX81

ASSEMBLY INSTRUCTIONS

APPROVED

This technical manual was OCR'ed for the Sinclair world by Andy Dansby.
andydansby@yahoo.com All intellicial information contained inside this technical manual is the property of Amstrad.

IMPORTANT: Read through the instructions before you start assembly.

If anything seems unclear or difficult, contact us for advice before going ahead.

1. PREPARATION

You will need a clean, dry and well lit workspace in which to assemble your kit. If possible, try to find somewhere where the parts can stay undisturbed in case you do not finish the kit all at once. It is a good idea in any case to split the work up - say assemble the circuit board one evening and put the case together the next evening. You will need these tools

- (a) A light electric soldering iron, say 15 to 25 watts with a fine tip
- (b) Fine gauge solder with resin flux core; NOT acid flux.
- (c) A pair of sharp sidecutters.
- (d) A 'Pozidriv' screwdriver with a No. 1 point.
- (e) A medium size ordinary screwdriver and/or a 4B A spanner.

The following items are optional, but useful -

- (a) A magnifying glass for examining solder joints and looking for short circuits,
- (b) Some desoldering braid or other solder removing tool. Better still, take care that you put the components in right the first time - removing them can be very difficult.
- (c) A piece of foam is useful to stop components falling out when you turn the board over to solder them

2. PRECAUTIONS

There are not many integrated circuits (I.C.s) in the kit, but they are all fairly expensive items and most of them are susceptible to damage from static electricity. There is no cause for worry if a few precautions are taken:-

- (a) Use the sockets supplied with the kit- never solder the I.C.s direct to the board - and keep the I.C.s in their protective packing until you are ready to plug them in.
- (b) Never insert or remove the I.C.s or do any soldering with power applied to the computer.
- (c) Use a soldering iron with a properly earthed bit.
- (d) Carpets and clothing of man-made fibres, and synthetic soles on shoes, are prone to building up a static charge. Earth yourself by touching a large object, preferably metallic, prior to touching the I.C.s. If you do get a shock, try changing your clothes or going barefoot (seriously!)

3. COMPONENT IDENTIFICATION

Before you start assembly, check the components against the component list (section 8) and make sure you know what each part is. We have tried to cover all different markings of the components, but variations are possible.

Note in particular that the computer's memory may be supplied either as two 18 pin I.C.s (IC4a & IC4b) or as one 24 pin device (IC4), and that assembly is necessarily different for each version.

Some components need to go in one particular way round -

- (a) The I.C.s have one end identified by a notch, and/or a spot or dimple next to pin 1 (See fig. 1) Note that all the I.C.s face the same way on the board, i.e. with their notches towards the edge connector.

Although the I.C. sockets do not need to go any particular way round, you may like to put the bevelled corner at the notch end of the I.C. position as a reminder, since the semicircle printed on the board will be covered by the socket in some cases.

(b) The diodes (prefix D) have their + end identified by the band painted on the body - or in the case of components with several bands, the + end will be the widest band. This corresponds to the flat bar of the symbol printed on the board. (See fig. 2).

(c) The electrolytic capacitors (C3 & C5) will have a + or - symbol printed on them, and the + wire is usually longer. (See fig. 3).

(d) The transistors (prefix TR) go in the board as shown by the picture printed at their positions - i.e. with their rounded corners facing the edge connector.

(e) The jack sockets and modulator need to have their business ends (i.e. where the plug goes in) facing outwards, away from the components. This should be obvious by inspection of the board and case.

(f) The regulator (REG) and heatsink need to go in a particular way round - just follow fig. 4.

(g) The keyboard connectors KB1 & KB2 have their pins offset from their centre line, and KB1 goes the opposite way round to KB2. Make sure that in each case the body of the connector covers up the component number on the board. (See fig. 5).

(h) The resistor packs (prefix RP) have a 'common' end marked with a white dot. This should go at the end marked with a 'C' on the board.

(i) The single resistors, the rest of the capacitors, and the filter X1 may be put in either way round.

4. CIRCUIT BOARD ASSEMBLY

The circuit board will be supplied with one side printed with all the component locations - this is the side the components go. This printing is reproduced as fig. 6 (See reverse side of sheet) since some of the markings will be covered by components. All soldering is done on the other side which is coated with a green solder resist - this keeps the solder away from where it is not needed. The exception is the edge connector area which should be kept free of solder to ensure reliable connection to the RAM pack or printer if they are used, We suggest you assemble the components in the following order, although it is not compulsory -

- (i) Resistors, capacitors and 1C sockets - do not plug the I C.s in yet.
- (ii) The diodes and transistors.
- (iii) The 'large' components: the sockets, keyboard connectors, modulator, the regulator and heatsink.
- (iv) Finally plug the I C s into their sockets.

The general procedure for each component:-

- (a) Identify the part and its position on the board and insert it into the appropriate holes, bending the leads if necessary. (But see later). In the case of components with a number of pins, make sure that they have all gone through their holes.
- (b) Hold the part in position - if you bend its leads to do this, do not press them flat onto the board as this will make them difficult to cut and will encourage short circuits.
- (c) Solder all the wires on the 'green side' of the board and, if they are long, trim them with the side cutters. No lead should stick out more than about 3mm or \sqrt{V} from the solder side.

Some components need more detailed explanation:-

- (a) The capacitors are represented by a capacitor symbol on the board, rather than a box as the rest of the components are. Fig. 7 explains how they fit in the board relative to the symbol.

- (b) There are four oblong boxes labelled R7-R10, R11-R14, R18-R22 and R23-R26. These all contain a row of resistors standing 'on end' as in fig. 8. Take care when mounting these: the length of bare wire up the side should not be allowed to short against anything else
- (c) IC2 and IC4 have two different sized boxes printed on the board¹ use only the holes corresponding to the smaller box.
- (d) As previously mentioned, IC4 may be in either one or two packages, Only the appropriate 1C sockets will be supplied, so make absolutely sure you know which version you have got before proceeding.

IMPORTANT:- If you have the 24 pin 4118 in your kit, a short wire link should be inserted in the holes at position L1 Use a component lead off-cut for this. DO NOT do this if you have two 18 pin 2114s, and do not put anything in position L2.

- (e) When mounting the regulator, do not bend its leads too close to the plastic. Bolt it down firmly with its heatsink *before* soldering.
- (f) Put the modulator's wires through the holes marked "Fr/UK1" and "UK2" Put each lead through the hole it is nearest to: do not cross them over Do not try to bend the thick pins on the modulator: hold it in place by hand whilst soldering. The black card trim is a push fit over the aerial socket.
- (g) The I.C.s will have their pins splayed out slightly and you may need to push them inwards slightly, e.g. by pressing against a flat surface, before they will fit the sockets. Make sure that each pin has in fact gone into its respective socket and that none are curled up under the I C.

5. TESTING

The completed board should now be checked *very* thoroughly for stray blobs of solder, dry joints, leads not trimmed, etc. Also make doubly sure that all components are in the right place and the right way round, and that the "stand up" resistors are not touching anything else. If everything seems in order, the board may be tested before you put it in the case. Rest the completed assembly on an insulating surface (e.g. these instructions) making sure there are no wire offcuts or similar trapped underneath. The keyboard's "tails" may now be plugged carefully into their connectors: the one with 5 stripes goes into KB1, the one with 8 stripes goes into KB2. These "tails" are quite fragile, so handle them gently. The keyboard itself should sit (the right way up) just in front of the circuit board - *Do not* remove the backing paper from the keyboard at this point.

You may now connect the computer to the T.V. and power supply and try it out - see the main instruction manual for details.

Once you are sure the computer is working correctly, put it in its case - see section 7. Do not strain the keyboard connections unnecessarily by using it uncased.

6. FAULTFINDING

Experience with the ZX80 has revealed that the majority of faults on kits are due to bad soldering. If your computer does not work, switch it off and **CHECK IT AGAIN**. If you find a bad joint or short, shame on you! You should have checked more closely the first time. If you are sure the fault is in the circuitry, try these tests--

(a) If the computer does not work at all, leave it on for a couple of minutes and feel the regulator - it should be getting warm. If not, check the power supply, and that the plug is in the right socket (the one nearest the keyboard). Otherwise, look at the connection to the T.V. and make sure it is tuned in properly - try between channels 33 and 39 UHF.

(b) If the computer works and then goes off, and the regulator gets very hot, it isn't bolted to the heatsink properly.

(c) If the cursor appears on the screen, but the keyboard will not enter, check firstly that the keyboard "tails" are properly in their connectors, and not twisted in anyway. Also make certain that the diodes and the keyboard connectors are all the right way round.

(d) If the screen goes clear but there is not a cursor, try disconnecting the power supply and waiting a few seconds before trying again.

(e) If horizontal black and white stripes pass through the picture, suspect the power supply. If you are using your own supply, it may need to be better smoothed (if the computer is otherwise working) or of a slightly higher output. See the power supply specification (section 9).

FIG 9

7 CASE ASSEMBLY

(i) Take the case top - the part with the raised "Sinclair" logo and "ZX81" printed on it - and feed the "tails" of the keyboard through the slot at the top right hand corner of the keyboard recess. Do not remove the backing paper from the keyboard yet, just locate it in the recess: see fig. 9. Hold the keyboard temporarily in place with a rubber band or a little sticky tape.

(ii) Hold the circuit board as in fig. 10 with the keyboard connectors next to the slot with the "tails" poking through. Plug the "tails" into their respective connectors as shown in the diagram, and turn the board over so that the components face into the case top behind the keyboard.

NOTE. Special attention must be made to ensure that the correct length of screw is used in the correct hole. The short screws are yellow in colour, the long screws are black in colour. Fig. 11 shows where

these locate Serious damage will result if the long screws are inserted in the wrong holes.

(iii) Locate the board on the pillars in the case, make sure the jack sockets are behind the holes in the side, and screw it into the case. Only two holes need screws in them at this point - Fig. 11 tells you which two; the others are for the case bottom fixing. Since the screws will have to form their own threads in the plastic, they may be a bit stiff to turn the first time therefore it is essential that the proper screwdriver should be used. An ordinary flat screwdriver will almost certainly slip, and may cause damage to the circuitry when it does. See the list of tools given in section 1

(iv) Turn the case the right way up again, peel the protective paper off the back of the keyboard and stick it into its recess in the moulding (the keyboard is self adhesive - no extra glue is necessary). It would be as well to position the keyboard correctly the first time, to avoid damaging it by continual relocating. Locate the top edge of the keyboard against the top edge of the recess, and stick it down carefully, working gradually towards the lower edge. Have a dry run first if you are in any doubt. Do not try to stick the whole surface down in one go.

(v) After checking that the keyboard connections are still securely in place, locate the bottom half of the case and screw it to the top with the remaining five screws. Finally the rubber feet plug into four of the recesses, over the screw heads. Fig. 11 shows the location of screws and feet.

(vi) Give the computer a final check, and start using it. . . .

8. COMPONENT LIST

Note that some components are marked on the circuit board, but shown as "not used" in this list. Do not put anything in these positions.

(a) Resistors.

All resistors have four colour bands: the fourth may be gold or silver.

No.	Value	Markings	Comments
R1	10K	Brown Black Orange	
R2	680 Q	Blue Grey Brown	
R3			Not used
R4	18K	Brown Grey Orange

TR1	ZTX313	
TR2	ZTX313	
D1-D8	* 1N4448 or 1N4148 or 1S44	Colours: Yellow, yellow, yellow, grey Yellow, brown, yellow, grey 2 Yellow bands

Some diodes may have their number printed on them instead.

D9	Not used	
X1	CDA 6 BMC	3 lead ceramic filter

(e) Other components

Modulator type UM1233
 3 off 3.5mm jack sockets for power, ear and mic.
 2 eff 40 pin 1C sockets
 Either 2 off 24 pin 1C sockets,
 or 1 off 24 pin and 2 off 18 pin 1C sockets

KB1 5-way keyboard connector
 KB2 8-Way keyboard connector
 Modulator trim (black card)
 Ready made flat keyboard
 Aluminium heatsink
 4BA nut, bolt and washer for fixing regulator and heatsink
 Printed circuit board
 2 Case halves
 4 Rubber feet
 7 Self tapping Pozidriv screws - 3 Black (long), 4 Yellow (short)

9. POWER SUPPLY

If you wish to use your own power supply with the ZX81, it should conform to these specifications - D.C. *only*-positive to the tip of the 3.5mm jack plug. Need not be regulated, but should be well smoothed.

Voltage - between 12 volts maximum and about 8 volts minimum (depending on smoothing) when on load.

Current - not less than 600mA, or 1 2A of the printer is to work from the same supply.

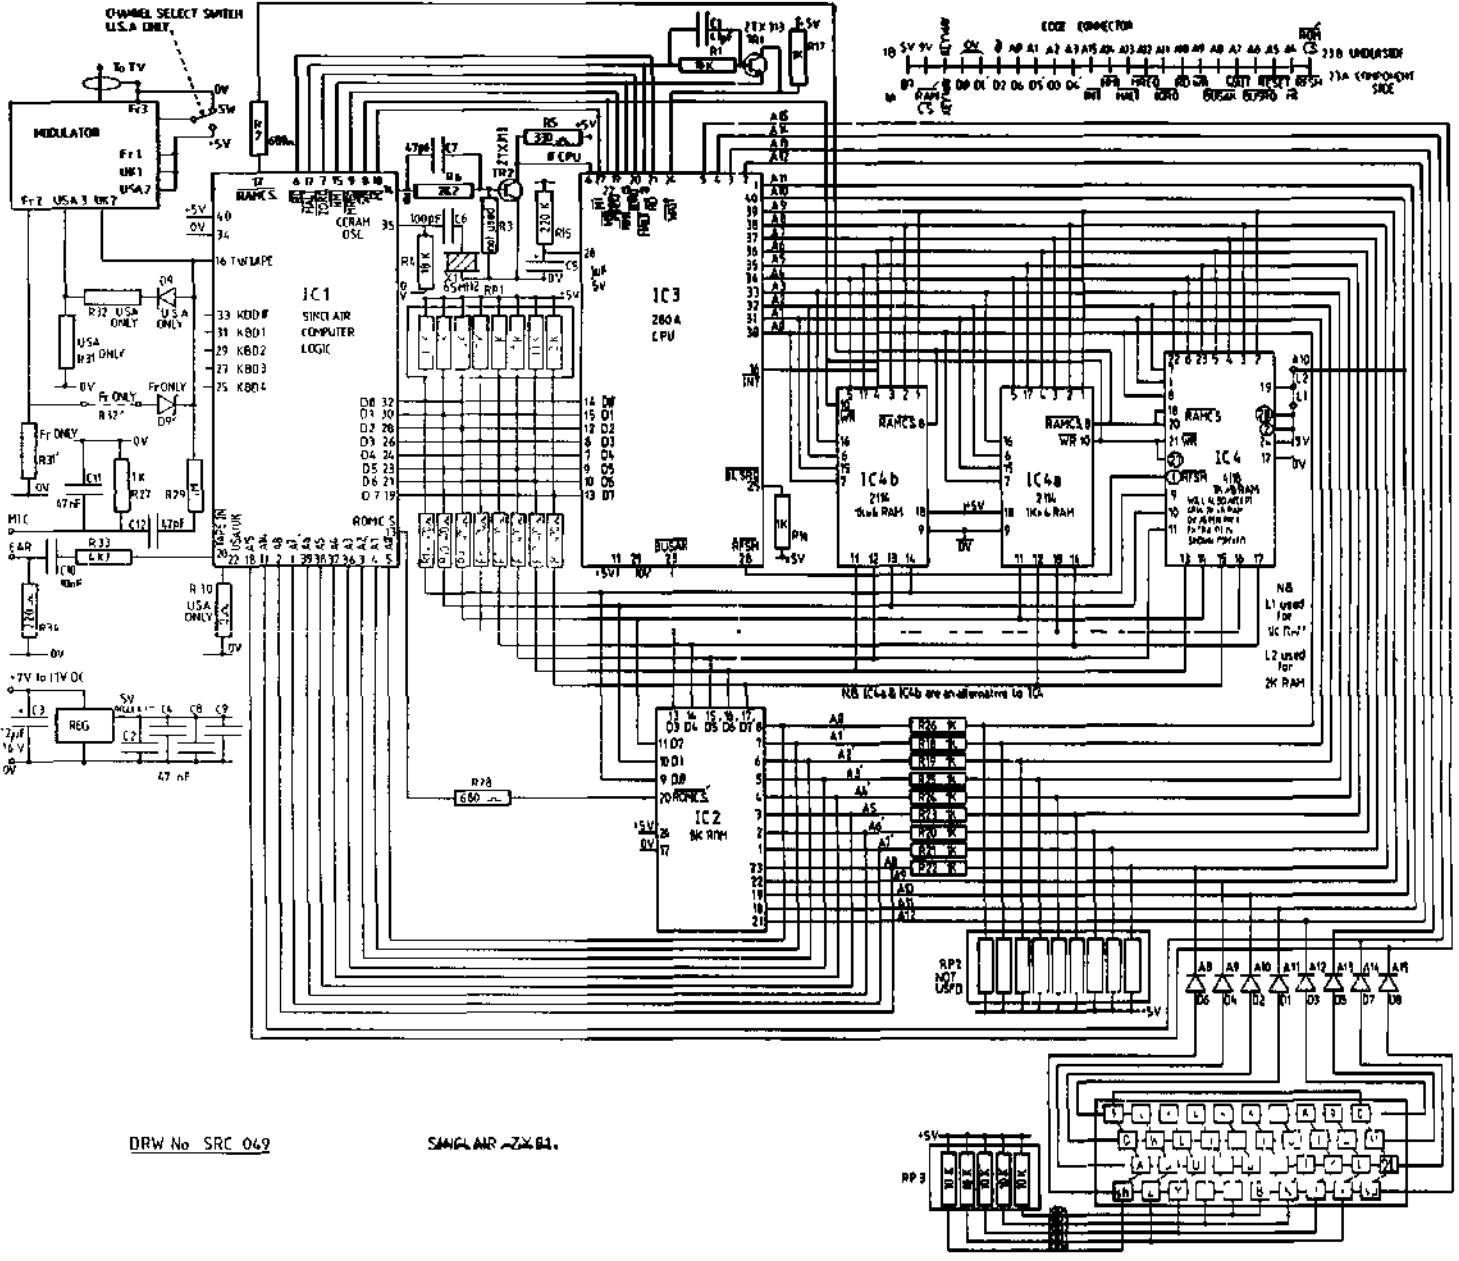

10. SERVICE

We will repair your completed ZX81 kit for a fixed fee of £10 00. We cannot assemble your kit for you, nor can we start work until the fee is received. In exceptional cases, say if the t.c.s have been damaged by being put in the wrong way round, we may ask for an additional payment.

On the other hand, if the trouble was due to faulty components supplied by us we will reui.j the full service fee. We strongly advise you, therefore, to be very certain that you have checked the computer *thoroughly* for mistakes before returning it: see also the hints in section 6.

If you do return your ZX81, pack it well and enclose a note giving your name and address, and explaining the symptoms of the trouble and any tests you may have done. Please return to this address:

General Notes:

Note the positions of the plug-and-socket switches (see Appendix A) and the numbering of the possible positions of the 5 connector plugs. Five distinct ranges of positions correspond to different selection functions described in detail below. There should normally be one plug in each of these ranges.

• i: L.I- _i- -. -' .- 'V' •

MBSA (Memory Board Start Address select);	1	0 (Start address of ZX81 8K ROM)
Selects the position in the 64K address space of the ZX81 microprocessor of the	2	8K free location above 8K ROM
Normally set to 27.30 that memory runs from address upwards.	3	1st free location above 8K ROM
	4	1st free location above 15K pack
	5	1st free location above 32K pack
	6	56K
	7	Nowhere! (re memory board disabled)
	8	MBSA (Set if no memory on memory board)
	9	MBSA+2K (Set for 2K (re 1 chip) on memory board)
ZES (ZX81 (1K) RAM select)	10	MB3A+4K (2 chips on memory board)
	11	MBSA+6K (3 chips...)
	12	MBSA+8K (4 chips...)
Selects distance above MBSA of the 1K RAM on the ZX81 board thus allowing it to be placed directly above the memory on the memory board without any gaps and used normally.	13	MBSA+10K (5 chips...)
	14	MBSA+12K (6 chips...)
	15	MBSA+14K (? chips...)
	16	Nowhere! (re ZX81 RAM disabled)
	17	Unused
	18	Unused
BSS ((Memory) Board Block Size select)	19	Must be set if more than 8K on memory board
If you wish the memory board to occupy only 8K of address space must set positions 22 and 24. Normal setting is 21 and 23 (for 16K block size).	20	Set if 8K or less on memory board.
	21	Set if more than 8K on memory board.
	22	Set if 8K or less on memory board.
TRS (Total RAM Select)	23	Set if total RAM not more than 16K.
Enables or Disables Address line 15 to MBSA decoder,	24	Set if total RAM is more than 16K.
	25	Unused
	26	
	27

General Notes;

All 5AM pack add-ons of 16K or over known to us (except for our own) have a built-in disable of the original 1K RAM on the ZX81 board. Hence it is not possible to use the 1K RAM on the ZX81 board if such an external memory is in use. As well as this it is necessary to make the Incremental RAM selection agree with the original firmware - ie the ZE plug must be set for dibble (see Appendix B).

Also, it should be understood, that the decoding for the 1K and 16K RAMS that exist in the ZX81 is only partial and ignores bit 15 of the address. If the total RAM is not more than 16K it is as a result of this necessary to mask bit 15 of the address to the TrsTr decoding and this is the purpose of positions 25 and 26 on the plug-and-socket switches. Clearly, if more than 16K RAM exists on the system it will be necessary to use bit 15 to differentiate between 16K blocks. Please refer to Appendix B for Jaotilogs «f. suujjzh. setting abbreviations.

Extracting chips from their sockets.

Take your time. The danger is that you are exerting a lot of force and suddenly one end of the chip comes away bending the remaining pins drastically. For this reason it is a good idea to lever the chip out with a screwdriver or pencil thus avoiding sudden movement. Care should be taken when levering not to damage the tracks under the socket (if the socket is of the open window type), it is usually possible to actually lever on the socket. Note that the chip body is extremely rugged - it is the pins which are fragile and which will stand only so much bending back and forth*

Insertion of chips into their sockets.

This is more difficult than extraction. Again, do not hurry.

It is possible to align the pins to the socket holes (ie getting them straight in line with the right distance between the rows) by grasping the chip firmly by the ends between thumb and forefinger and pressing a row of pins flat down on the table being careful to avoid sudden slips. Once the pins are reasonably well aligned the chip should be placed in the socket (the right way round!) with the pins located in the holes in the socket plastic (but not yet in the connectors) . It can then be jiggled into place keeping a close eye for caught pins which are starting to bend.

Pin numbers of chips.

By convention, with the chip on the table before you standing on its pins with the indentation at the end of the chip body away from you, the pins are numbered starting at J at the far corner on the left, down the left side and back up the right side to the far right hand corner. It is frequently disastrous to insert chips the wrong way round in their socket iadd apply power.

You will require a small conventional screwdriver, a small phillips (cross headed screw screwdriver and the ZX81 manual.

Refer to Appendix A for description of board layout.

Remove all leads and attachments from your ZX81.

Place ZX81 on table before you as for normal use.

Turn ZX81 over as though it were the front cover of a 'book,

Peel off the footpads located at the HI, SW, and SE corners of the bottom of the ZX81J

Completely loosen the five small recessed bolts which are now visible and lightly replact footpads to avoid losing the three corner screws.

Lift of the bottom of ZX81 case and put it aside.

Remove the two additional bolts now visible, remembering thai* position.

Note that the ZX81 board is now attached to the keyboard half of the case by just a thin ribbon cable which you must take care not to damage. We do not recommend that the ribbon be removed from its socket on the ZX81 board and there is no necessity to do this if thes instructions are followed.

taking care not to strain the ribbon ca"ble, turn the ZX81 board (not the case) over as though it were the top card on a deck (ie. the heat sink (big rectangle of metal) goes under the board and away from you).

Turn to the chapter in the ZX81 manual entitled 'How the computer works' which contains a picture of what now lies before you. Note the positions of the CPU and the IK HAM,

Take the memory board and find the positions of the ROM CS and the RAM CS depicted thereon. With these depictionsuppermost and towards you, position the memory board over the ZX81 board with the 40 protruding pins lying directly over the CPU on the ZX81. This is the position of fitting which you should now remember.

If the Sinclair IK RAM is socketed (rather than soldered to the ZX81 board) then remove it and put it aside, (see section entitled 'Hints and Tips' for advice on removal and insertion of chips)

Remove CPU from ZX81 and insert it into memory board being sure to match indentation at end of CPU body with paint spot on memory board.

Remove the 14BA bolts (there are 4) and washers from their guides on the memory board. Note - you could fit the memory board directly in this position but this would necessitate the removal of the ribbon cable from its socket in order to turn the board assembly back on its tummy for reassembly of the case. - Instead make sure you know the poistion of fitting before going on to next step.

Swivel the ZX81 heat sink to the extreme right to be sure of clearing thsraemory board when fitting. Do not forget to move it back later!

Turn ZX81 board back on its tummy (ie components downward) .

Turn ZX81 (including ca.se) round 180 degrees so that heat sink is away from you.

Lift ZX81 board with left hand slipping memory board underneath it and around the ribbon cab. and into poition with the other hand (ie so that pins are directly under ZX81 CPU socket) .

Carefully insert pins into ZX81 CPU socket with even pressure from thumbs on CPU body - Be extremely careful to be sure that all 40 pins are going in straight and are not bending. Do not insert too far into the socket - the correct depth of insertion will be automatically attained on fitting the four bolts.

PTO

Having fitted the memory board to your ZXSl, now remove anything you may have p in to the expansion port. Then -

(i) Turn on your ZXSl and wait a few seconds for the cursor to appear,

i IF the cursor came up as normal THEN GOTO (iv).

(11) The cursor hasn't come up so try turning on ZXSl a couple more times. If still unsuccessful the problem is almost certainly a bad connection between the memory I and the ZX81 board. So -

IF you have a multimeter

Test all 40 pins of the GPU connect through to the ZXSl board.

Test all 4 bolt guides connect to track on ZX81 board.

Check that washers are not causing shorts on ZX81 board.

IF all connections seem OK then it is likely that there is a fault in the memory board
GOTO end - testing failed,

IF you do not have a circuit tester then remove the memory board and check that no pins are bent over. If they are it may be possible to straighten it again without breakage. If one breaks then there is nothing for it but the soldering iron¹

*,iv) Find out the contents of RAMTOP (see ZX81 manual if interested) as follows -
Type in

PRINT PEEK 16389

the result will come up on the screen and should be checked against the table below. Note that if the original IK RAM has been removed from the ZXSl board that the RAMTOP value should be 4 less than the figure in the table. If this is the case and RAMTOP is correct then you may plug in the removed IK chip (if it is IK of course) to the first available socket on the memory board - at the same time you ought to move the plug selecting the IK SW1 to disable (position 18) to avoid the ZX81 decoding fighting the memory board decoding and consuming unnecessary current*

TABLE of correct RAMTOP values.

Number of 2K chips fitted to memory board.	Corresponding value of RAMTOP
0	68
1	76
2	84
3	92
4	100
5	108
6	116
7	124
8	128

IF RAMTOP does not correspond to the number of memory chips then

Note the actual value obtained

Obtain the value of location 16388 (type in PRINT PEEK 16388 to get this) and note Call us.

end.

(Continued)

Position the four bolts and washers back into their original positions except that now of course they pass through corresponding holes in the ZX81 board. Note that if they do not push in freely they may be lightly screwed in.

Engage the bolts in the nuts soldered to the ends of the bolt guides to take the memory i firmly up to the ZX81 board establishing a rigid structure and firm electrical connector between the bolt guides and the ZX81 board track. Check that the washers are nbt causing shorts on the ZX81 board (this can happen if the ZX81 board coatings are worn away - the washers are there to prevent such \wear from the bolt heads.)

(Note that it is possible in this situation to fit the top three memory chips next to the CPU (ie it is not necessary to separate the memory board from the ZX81 board in order to them))»

IMPORTANT!!!!!!!!!!!!I !!!!!!!
IMPORTANTFMM!!!!!!!!F!ii'f!

DO NOT FORGET TO KOVE THE HEAT SINK BACK as follows - Swivel the heat sink hard up againai the protecting pin on the memory board - Failure to do this can cause a disastrous short on the ZX81 board!

Position the board assembly snug into the ZX81 case top ensuring that the fourcase lugs have cleared the holes provided for them in the memory board.

Refit the two bolts securing the ZX81 board to the keyboard half of case (in the correct positions).

(Note that in this situation the first five memory sockets are accessible as we&l as all 26 positions of the plug-and-socket switches) .

Replace the bottom half of ZX81 case - the securing of the five bolts can be postponed till testing is successfully completed).

Test (see section on testing) .

REMOVING

Remove all leads from ZX81.

Remove bottom of ZX81 case (see 'Fitting').

Remove the two bolts securing board assembly to keyboard half of case.

Remove the four 15BA. bolts & washers securing the memory board to the ZX81 board.

Place a medium size screwdriver between memory board and ZX81 CPU socket and carefully Lever the boards apart being- sure not to bend pins as they come out of CPU socket. Make sure that the point of the screwdriver pushes on the ZX81 CPU socket and not on board tracks which might bo so damaged,

FITTING OF ADDITIONAL MEMORY CHIPS,

Remove ^11 leads and attachments from ZX81 and remove bottom of case (See 'Fitting')•

Note that the memory sockets are numbered from 1 to 8 (see Appendix A) and will normally be filled in that order.

IF the sockets_v 1 to 5_v are already filled THEN_v two bolts securing Doard assembly to keyboard half of case.

Carefully place whole assembly with keyboard uppermost and move keyboard to expose memory sockets (do not strain the ribbon cable) . Support the board with fingers as you plug in the memory chip to the first available socket (see Hints and Tips) .
ELSE IF sockets 1 to 5 are not all filled then sir-rfv -i"~ ^ -v-4- *-- *-- "

When all is well, Insert the diode and transistor the correct way around as indicated in fig 1. Finally insert the 4 ICs, again consult fig 1 for polarity. ICQ Inserted the Wrong way artpund will almost certainly be destroyed when the board is plugged in so be particularly careful here

When construction is complete, plug in the board, and apply power to the ZX. Again the machine should operate as normal if not, check that the ICs are correctly inserted, and that there are no board shorts.

Once the board is functioning there are many tests and experiments that may be performed including full frequency range audio output. See article in Personal Computer World (October and November 1981), But here are some introductory notes!

Output Port

Connection to the port are shown in fig 2. There are 8 separate output channels, and they may be controlled with a single poke statement! POKE 25000, X for the ZX80 or POKE 11000, X for the 81. X may be any integer between 0 and 255. With £=Q all output lines are set to logic low, whilst 255 sets them all high. To set any one channel high while leaving the remainder low, the following values should be used:

POKE VALUE (X)	CHANNEL ACTIVATED
1	0
2	1
4	2
8	3
16	4
32	5
64	6
128	7

Thus the command POKE 25000, 16 (or POKE 11000, 16 on the 81) will set channel 4 high, leaving the others low. Setting a high output on a number of channels is achieved by combining the data. Thus POKEing the value 12 (=9+4) will set channels 2 and 3 high.

When a channel goes high it may be used to trigger a variety of devices. Fig 3 shows LED indicator lamps attached to channels zero and one. To light these, execute POKE 25000, 3 (or POKE 11000, 3 on the ZX81).

Volume may be controlled from each channel as shown in the application notes, and sound output may be produced by connecting a high impedance (eg 65 ohm) loudspeaker to the output plug. In fig 4. The following programs will produce blips on the loudspeaker.

10	EB ZX80 BLEEP	10	HEM ZX81 BLEEP
20	FOR A = 1 TO 100	15	FAST
30	POKE 25000,1	20	Kill A = 1 TO 100
40	POKE 25000,0	30	POKE 11000,1
50	HBCT A	40	POKE 11000,0
		50	NEXT A

To produce a higher frequencies and more interesting effects it is necessary to use a machine code subroutine, and complete programs for this on both ZX80 and 81 are given in the applications notes, and in PCW.

Telephone 01-452 1500 01-450 6597

IBS ZX80/61 Pom - KOTES TO ACCOMPANY KIT

The following is provided:-

- 1 Double Bided FOB
- 4 IOB labelled 1 - 4
- 1 Diode (IN9-14) (glassy)
- 1 Resistor (1K)
- 2 Capacitors (100n?) (round and flat)
- 2 14 Pin DIL Sockets
- 2 16 Pin DIL Sockets
- 2 20 Pin DIL Sockets
- 1 23 x 2 0 1" edge connector
- 2 16 Pin Header Plugs
- 1 2S2926 (green) Translator
- 1 HAH pack extender card (ZX81 only)

Construction

Begin construction as follows! Insert and solder in the 6 IC Sockets, putting in the largest ones first. Next solder in the 2 3 way edge connector, but if the board is for use with the ZX81 do not trim short, the wires protruding through the underside of the board, because these will be used for connecting the RAM pack extender card, (this is not possible on the ZX80). Be very careful not to bridge adjacent tracks when soldering this socket. To reduce the risk of this you can leave unsoldered any pins that don't appeal to join up to a track on the underside of the board. Insert the two capacitors and resistors, and solder these.

Next solder the through connections at all the remaining holes that have solder pads on the upper side of the board except

EITHER the three marked «A" if the board is for use with a ZX81 (note that the third 'A' is somewhat obscured by the edge connector)

OR the two marked B if it is for a ZX80. The through connections require a piece of wire to be passed through the board, and carefully soldered both sides before clipping off.

At this point, and before inserting the ICs or the diode and transistor, plug the board into the ZX80/81, and plug the power plug into the computer. The cursor should appear, and the ZX should work normally. If it does not, there is a short circuit somewhere on the board - probably between a pair of adjacent tracks. The short can be traced (after unplugging the board) using a multimeter on the ohms range, or other continuity tester (eg battery and bulb) - or you can search visually. If it is a solder bridge then you must re-solder the point, but you may find that you can clear the short by passing a small screwdriver blade between the offending tracks.

Input Port

Connections to the input port are shown in *fig 5*. Again there are 8 separate channels, and they may be read with a single PEEK statement. The command `PHIHT PEEK (25000)` on the ZX80, or `PBIHT PEEK 11000` on the 81 will print a value between 0 AND 255 representing the state of the 8 lines. If any line is held at logic low it will contribute a zero to this figure. If it is at logic high it will contribute a value corresponding to the data on the POKE table above. Thus if channels zero and 7 are high, but the rest low, the value printed by the PEEK statement will be 129 (=128+1), and BO on.

The circuit of *fig.6* shows a single push button connected to channel 7. When the button is pressed, channel 7 will go high - otherwise it is kept low by the resistor to ground.

To test the state of the switch, use an expression such `B.BJ`

```
IP PEEK (25000)>127 TEHH GO TO 100 (ZX80)
```

```
or IP PEEK 11000 T 127 THHS GO TO 100 (zxai)
```

This will cause a jump to line 100 if the switch is closed. Note that if nothing is connected to any channel, it will resume a high state BO that PEEK-ing the port with nothing connected should produce a value of 255. If it does not, then all board connections should be checked.

Further applications details are given in the applications booklet.

BAM Pack Extender Card

Once the port is working satisfactorily on both Input and output, the extender card should be soldered in. This allows the simultaneous use of the RAM pack and port board on the ZX81, though this is not possible on the ZX80. The extender card solders to the rear of the edge connector to effectively extend the extension plug at the rear of the ZX81. See *Figs 7 & 8*. To wire up the card, first bend the edge connector pins towards each other so that the card just fits between them. Then position the card between them as in *Figs 7 & 8*. The card should be positioned with notch outwards (i.e. away from the main port board), and exactly at right angles to the port board. How carefully solder the 22 upper and 22 lower pins to the extender card, keeping the card at right angles to the main board.

When you have checked that there are no solder bridges, you should be able to plug the RAM pack into the extender card, and the port onto the ZX81. To use this tandem arrangement satisfactorily, the ZX01 and extensions should be kept on a flat surface to avoid poor contacts through flexing of the board. If the system fails to operate with the RAM connected, try flexing the arrangement and reinserting the RAM plug. All boards should be inserted as far as they will go.

Note when using the RAM pack as well as the port board you will not be able to drive so many external devices (lamps, relays etc) with the output port. If in doubt, check that the ZX81 is not getting too hot.

Errata

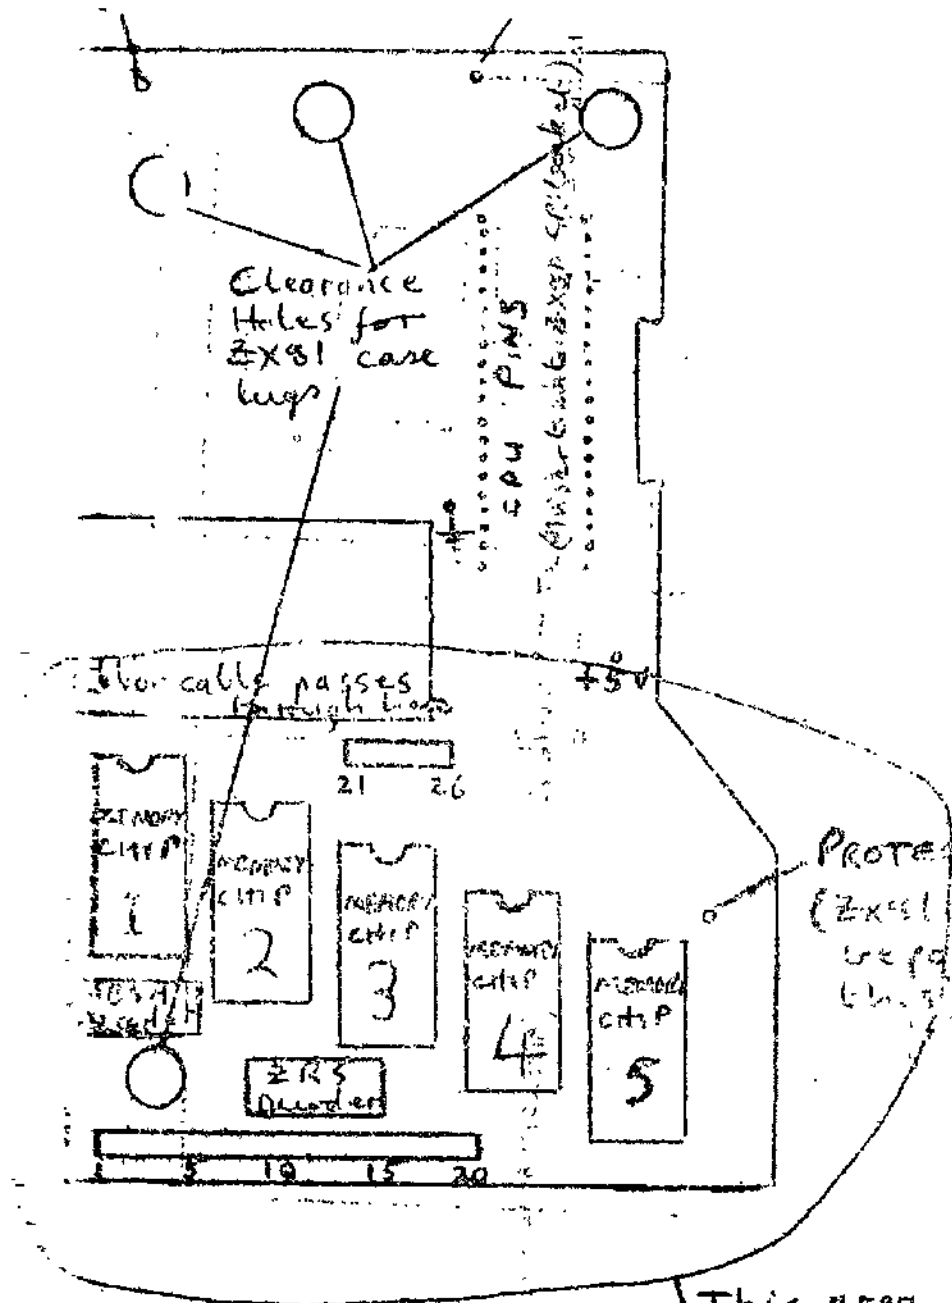

There are two minor corrections to the circuits issued in the applications booklet and in PCW.

1. In all applications using the high impedance loudspeaker, this should be connected via a 10 mfd capacitor to earth as shown in *fig 4* of the attached sheet, and not directly to the positive supply as in PCW.

2. In all applications of the solid state buzzer, this should be connected between the particular channel that it is used with, and the positive supply (pin 16), rather than earth (pin 9). The polarity of the buzzer should also be reversed, so that its red lead is on the positive supply. It will function as connected in the applications circuit, but it works more effectively as described here.

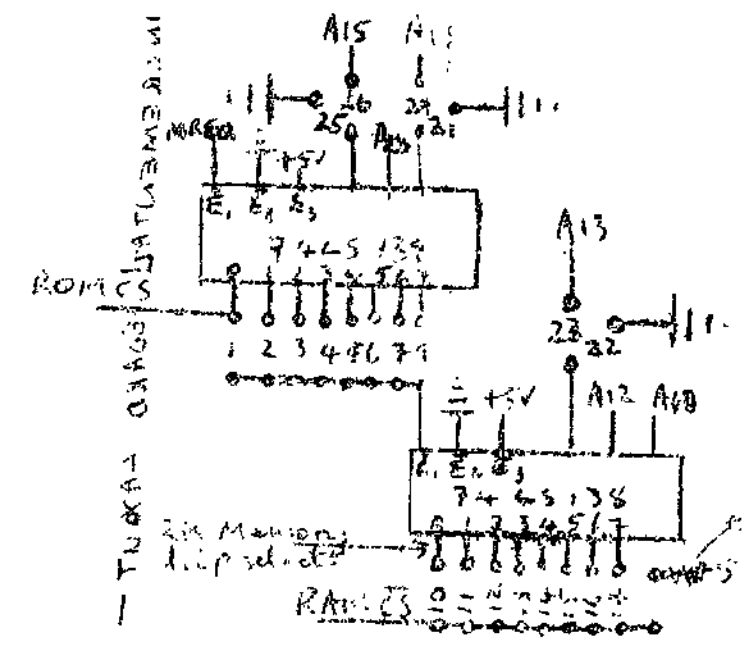

Loudspeaker

A suitable loudspeaker for audio output may be obtained from Technomatic Limited at S0p + P4P + TAT.

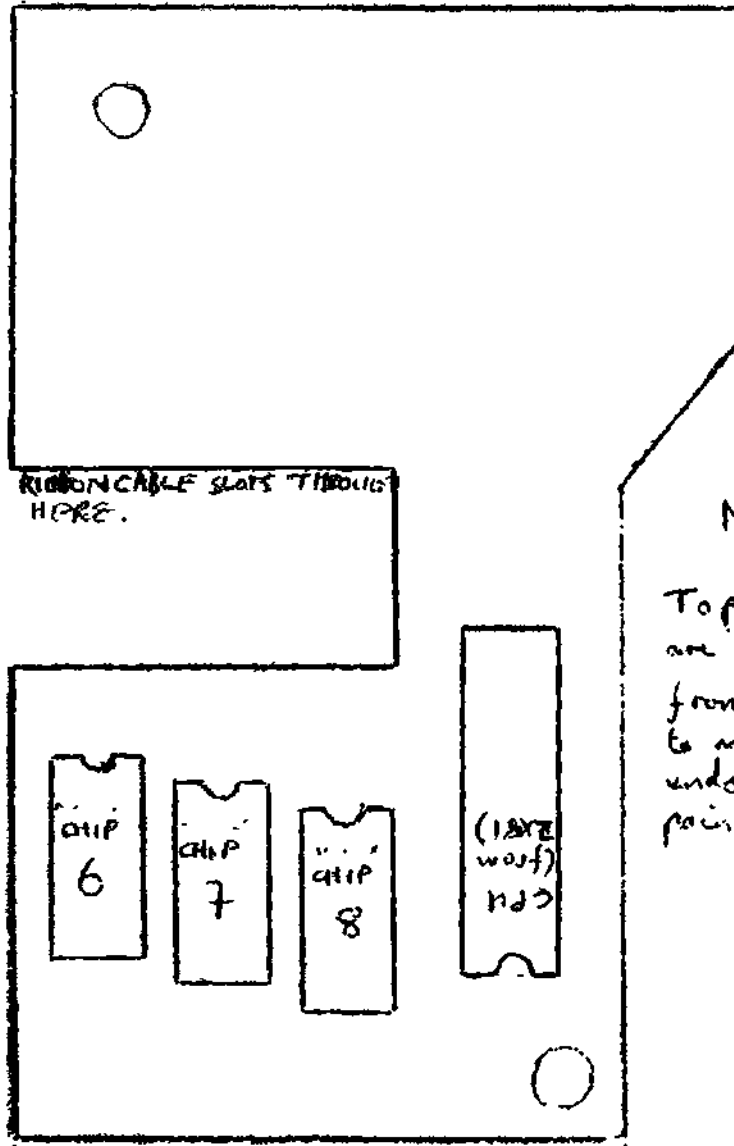

This area is accessible with just the bottom of EX81 case removed.

BEFORE UNPACKING

PLEASE NOTE ! - the position of the 40 protruding pins protected by the clock of polystyrene foam. We suggest that this protection be retained until actual fitting. Also we strongly recommend the fitting and testing of the memory board as supplied before carrying out any adjustment to switch settings, plugging-in extra chips etc.. Finally, from "bitter experience, we think it aorth reading the instructions right through before doing anything else.

APPENDIX FOUR

This table shows, in more or less alphabetical order (except where not convenient), each 280 instruction and either its hexadecimal code, or the words "table 1", "table 2", or "table J". In such a case, looking up the appropriate table will give the hexadecimal code required. This appendix also lists the flags that are altered by each instruction. Usually it will be impossible to test flags R and N, but note that PUSH AF followed by POP BC allows you to test all of the flags by then examining the register C. The symbols used here are:

- @ The flag is altered by the instruction.
- 0 The flag is NOT altered by the instruction.
- 1 The flag becomes zero
- 1 The flag becomes one
- ? Random.
- x Special case. An explanation will be given

There are fundamental differences between machine code programming and BASIC programming. One of the most fundamental differences is that of LINE NUMBERS.

As you know, every BASIC instruction in a program must be preceded by a line number, so that the computer knows in which order to execute them. If no line number is given the computer will interpret the instruction as a COMMAND and will execute it immediately.

In machine code, there are no line numbers. Also, the ZX80/81 will not allow you to use machine code instructions as commands, they MUST form part of a program. The instructions are executed in the order that they are stored. For example, if the computer had just finished executing the instruction which was stored in location 30000, it would then go on to execute the instruction held in location 30001. It will continue in this way until it received an instruction telling it to do otherwise.

Unlike BASIC, it will NOT automatically stop when it reaches the end of the program. It will plough right on through the addresses, and every time it finds a number which is not zero it will simply treat that number as a code for some instruction and try to execute it. Usually this will result in what is called a CRASH.

ABOUT CRASHING

Crashing is the name we give to what happens when your (up until now at least moderately well-behaved) Sinclair machine unwittingly tries to execute something it shouldn't, or if there is a drastic mistake in your machine-coding which will

RE7.7 KEYBOARD CONSTRUCTION NOTES.

FireU check the contents of your kit, which should contain the following:-

Quantity	Description	Quantity	Description
1	RE77 FOB	26"	Link wire
40	Keyawitchss	8"	Sleeving
40	White keytops	18"	20 way ribbon cable
40	Clear key* covers	1	Legend Set

Fit sixteen short wire links as shown on fig 1, then fit two long wire links which should have sleeving. Put the 40 keyawitches into place. Note that the pins in the switches are offset from the centre, and if you try to put the switches in the wrong way round the switch body will foul the wire links.

Having placed the switches, put a sheet of card over them, turn the printed circuit board over and solder the switches. Check that all the switches are resting firmly on the P.C.B. and are straight.

Fit the 40 white keytops and push on firmly. Take the legend set and place it on a firm card. Using a Steel rule and a sharp knife, cut out the letters using the edge markers as guides. You may prefer to draw faint lines and use scissors.

Using your computer or handbook as a guide, place the legends one at a time on the keypad and push on the clear plastic top.

If you have purchased the RE77B connector solder the ribbon cable to it (4 of the wires are unused and may be removed). If you do not wish to use a connector the cable may be soldered to the PCB. The completed keyboard may now be fitted to your ZX80 or ZX81. First study the connection details for your computer. (Fig 2 and fig 3) (More details on figs 4 and 5)

Carefully solder the ribbon cable to the computer PCB as indicated. The ribbon cable may now be run out of the case underneath the PTYM pack connector. Recheck all your soldering, then test your computer and new keyboard.

Fold your keyboard cable under your ZX80/81. Push the computer board to the back of your desk with your new keyboard in front. This way you have no untidy twists in your cable.

FITTING KEYBOARD TO ZX80 AND ZX81

FITTING TO ZX81

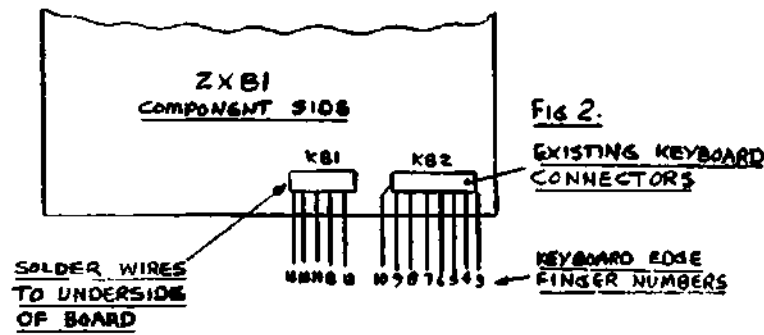

FIGURE 1

IC4b	µPD2114LC-1	18 pins
REG	7805	5 Volt regulator
TR1	ZTX 313	
TR2	ZTX 313	
D1 D8	*1N4448	Colours Yellow, yellow yellow grey
	or 1N4148	Yellow brown yellow grey
	or 1S44	2 Yellow bands

Some diodes may have their number printed on them instead

D9		Not used
X1	CDA 65MC	3 lead ceramic filter

(e) Other components

Modulator type UM1233
 3 off 3.5mm jack sockets for power, ear and mic
 2 off 40 pin IC sockets
 either 2 off 24 pin IC sockets
 or 1 off 24 pin and 2 off 18 pin IC sockets
 KB1 5 way keyboard connector
 KB2 8 way keyboard connector
 Modulator trim (black card)
 Ready made flat keyboard
 Aluminium heatsink
 4BA nut bolt and washer for fixing regulator and heatsink
 Printed circuit board
 2 Case halves
 4 Rubber feet
 7 Self tapping Pozidriv screws - 3 Black (long) 4 Yellow (short)

9. POWER SUPPLY

If you wish to use your own power supply with the ZX81 it should conform to these specifications
 D.C. only - positive to the tip of the 3.5mm jack plug. Need not be regulated but should be well smoothed

Voltage - between 12 volts maximum and about 8 volts minimum (depending on smoothing) when on load

Current - not less than 600mA or 1.2A if the printer is to work from the same supply

10. SERVICE

We will repair your completed ZX81 kit for a fixed fee of £10.00. We cannot assemble your kit for you, nor can we start work until the fee is received. In exceptional cases, say if the I.C.s have been damaged by being put in the wrong way round, we may ask for an additional payment.

On the other hand, if the trouble was due to faulty components supplied by us, we will refund the full service fee. We strongly advise you therefore to be very certain that you have checked the computer thoroughly for mistakes before returning it - see also the hints in section 6.

If you do return your ZX81 pack it well and enclose a note giving your name and address and explaining the symptoms of the trouble and any tests you may have done. Please return to this address:

ZX81

ASSEMBLY INSTRUCTIONS

(iii) Locate the board on the pillars in the case, make sure the jack sockets are behind the holes on the side and screw it into the case. Only two holes need screws in them at this point - Fig. 11 tells you which and the others are for the case bottom fitting. Since the screws will have to form their own thread in the plastic they may be a bit stiff to turn the first time, therefore it is essential that a proper screwdriver should be used. An ordinary flat screwdriver will almost certainly slip, and may cause damage to the circuitry when it does. See the list of tools given in section 1.

(iv) Turn the case the right way up, peel the protective paper off the back of the keyboard and stick it into the recess in the moulding (the keyboard is self-adhesive - no extra glue is necessary). It would be as well to position the keyboard correctly the first time, to avoid damaging it by continual repositioning. Locate the top edge of the keyboard against the top of the recess, and stick it down carefully, working gradually towards the lower edge. Have a dry run first if you are in any doubt. Do not try to stick the whole thing down in one go.

(v) After checking that the keyboard connections are still securely in place, locate the bottom half of the case and screw it to the top with the remaining five screws. Finally the rubber feet plug into four of the recesses over the screw heads. Fig. 11 shows the location of screws and feet.

(vi) Give the computer a final check, and start using it.

8. COMPONENT LIST

Note that some components are marked on the circuit board, but shown as "not used" in this list. Do not put anything in these positions.

(a) Resistors

All resistors have four colour bands - the fourth may be gold or silver.

No.	Value	Markings	Comments
R1	10K	Brown Black Orange	
R2	5.22Ω	Blue Grey Brown	
R3			Not used
R4	12K	Brown Grey Orange	
R5	220Ω	Orange Orange Brown	
R6	22Ω	Red Red Red	
R7	470Ω	Yellow Purple Brown	
R8	470Ω		
R9	470Ω		

K10	470 Ω
