1) Tested with pulses $t_p = 20$ ms, Measured under thermal equilibrium and DC test conditions.

2) The zener impedance is derived from the 50Hz AC voltage which results when an AC current having an RMS value equal to 10% of the Zener current (Izt or Izk) is superimposed on Izt or Izk. Zener impedance is measured at two points to insure a sharp knee on the breakdown curve and to eliminate unstable units.

3) Valid provided that electrodes are kept at ambient temperature.
