

Dual LDO

Monolithic IC MM3549 Series

Outline

MM3549 are dual LDO by small package. The IC are used for a smart phone's and mobile phone's RF or CMOS sensor power supply by high PSRR and load response.

300mA *2ch, PLP-8 (1216size)

Features

1. Maximum input voltage	7V
2. Maximum operating voltage	6V
3. No load input current	40μA typ. (1ch)
4. Quiescent current (OFF)	0.1μA typ. (Vce=0V)
5. Output voltage range	1.2 to 5.0V (0.1V step)
6. Output voltage accuracy	±1.0%/±20mV (Vo≤2V)
7. Dropout voltage	0.22V typ. (Io=300mA, Vo=3V)
8. Line regulation	0.1%/V max.
9. Load regulation	40mV max. (Io=1 to 300mA)
10. Vout temperature coefficient	±100ppm/°C typ.
11. Output NMOS ON resistance	10Ω typ.
12. Output Capacitor	1.0μF

Package

PLP-8E

Applications

1. Smart phone
2. Mobile phone
3. DSC

· Note

- There is a possibility with deterioration and destruction of IC when using it exceeding the absolute maximum rating.
The absolute maximum rating, Never exceed it.
The functional operation is not assured.
- There is a possibility that it becomes impossible to maintain this performance and reliability IC original when using it exceeding recommended operation voltage.
Please use it in recommended operation voltage.
- Due to restrictions on the package power dissipation, the output current value may not be satisfied.
Attention should be paid to the power dissipation of the package when the output current is large or the voltage between Input and Output is high.
- The output capacitor is required between output and GND to prevent oscillation.
- The ESR of capacitor must be defined in ESR stability area.
It is possible to use a ceramic capacitor without ESR resistance for output.
The ceramic capacitor must be used more than 1.0 μ F and B temperature characteristics.
- The wire of VDD and GND is required to print full ground plane for noise and stability.
- The input capacitor must be connected a distance of less than 1cm from input pin.
- In case the output voltage is above the input voltage, the overcurrent flow by internal parasitic diode from output to input. In such application, the external bypass diode must be connected between output and input pin.

- It is able to an unstable operation when you use the capacitor with intense capacitance change
The capacitor has the dependency at the power-supply voltage and the temperature.
The capacity value changes by the environment used. Please evaluate IC in the set.
- The overcurrent protection circuit of foldback current limit type is built into this IC.
- This IC have not the thermal shutdown protection.
- This IC will limit the output current with the overcurrent protection circuit when the overcurrent and the output do short-circuit.
However, IC generates heat because of the substrate and use conditions and there is a possibility of destroying it exceeding a permissible loss.
The characteristic changes depending on the substrate condition.
Please evaluate IC in the set.
- This IC has the pull-down function of the CE terminal.
The pull-down function uses the internal constant current source.
- The short circuit electric current has dependence of the input voltage.
Short circuit electric currents more than 100mA may flow ($V_{DD} \leq 2V$).
- Transient response characteristics may turn worse, when dropout voltage is less than 0.5V.
When a dropout voltage does not have a margin, please evaluate it enough.
- It may become unstable when output current is less than 10mA ($V_{out}(typ.) < 1.7V$).
- When the terminal VDD(CE) is OFF→ON, the overshoot might be generated.
The size of the overshoot depends on "output capacity", "output load", a "voltage rank", and "VDD standup speed." and evaluate it enough with a real machine, please.

About Power Dissipation

The Power dissipation change if board to mount IC change because radiative heat fix at board. It is reference data below, Evaluate IC in the set.

1. JEDEC51-7 standard

Board size 114.3mm×76.2mm t=1.6mm Copper foil area 80%

Power dissipation 1250mW Ta=25°C (It is reference value measured by JEDEC51-7 standard.)

It is recommended to layout the VIA for heat radiation in the GND pattern of reverse (of IC) when there is the GND pattern in the inner layer (in using multiplayer substrate).

By increasing these copper foil pattern area of PCB, Power dissipation improves.
