

200mA LDO

Monolithic IC MM3566 Series

Outline

This IC is a low quiescent current 200mA LDO.

The IC can be stable behavior without Input/Output capacitor.

Therefore the number of external capacitor is reduced.

The IC can be better low quiescent current and load transient by bias boost circuit.

Therefore the IC is ideal for mobile applications.

Features

1. Maximum operating voltage	6.0V
2. No load input current	0.9 μ A typ. ($V_O=1.2\sim3.3V$)
3. Quiescent current (OFF)	0.1 μ A typ. ($V_{ce}=0V$)
4. Output voltage range	1.2~5.0V
5. Output voltage accuracy	$\pm 1.0\%$ ($V_O>2V$)
6. Dropout voltage	0.35V typ. ($I_O=200mA$, $V_O=3V$)
7. Line regulation	0.1%/V max.
8. Load regulation	40mV max. ($I_O=1\sim200mA$)
9. V_{out} temperature coefficient	$\pm 80ppm/^{\circ}C$ typ.
10. Output NMOS ON resistance	10 Ω typ.

· Note

1. Please use this IC within the stated absolute maximum ratings.
The IC is liable to malfunction should the ratings be exceeded.
2. Due to restrictions on the package power dissipation, the output current value may not be satisfied.
Attention should be paid to the power dissipation of the package when the output current is large or the voltage between Input and Output is high.
3. The wire of VDD and GND is required to print full ground plane for noise and stability.
4. In case the output voltage is above the input voltage, the overcurrent flow by internal parasitic diode from output to input. In such application, the external bypass diode must be connected between output and input pin.
5. This IC will limit the output current with the overcurrent protection circuit when the overcurrent and the output do short-circuit.
However, IC generates heat because of the substrate and use conditions and there is a possibility of destroying it exceeding a permissible loss.
The characteristic changes depending on the substrate condition. Please evaluate IC in the set.
6. Please keep in mind that output voltage may rise by the leakage current of a power transistor if it is used by low load current ($I_o < 10\mu\text{A}$) at the time of high temperature.
7. When the terminal VDD (CE) is OFF → ON, the overshoot might be generated.
The size of the overshoot depends on "output capacity", "output load", a "voltage rank", and "VDD standup speed." and evaluate it enough with a real machine, please.
Please refer to Output Rise & Rush Current (P13, 18, 23) Turn-ON Transient Response.
8. There is a possibility of becoming load transient response characteristic deteriorates when using it with Dropout voltage less than about 1V. Please evaluate it enough when there is no margin in Dropout voltage.
Please refer for examples Load Transient response (P12, 17, 22) characteristic.
9. The IC is not an air discharge measures product.
10. The IC does not have the thermal shutdown protection.

About Power Dissipation

The Power dissipation change if board to mount IC change because radiative heat fix at board. It is reference data below, Evaluate IC in the set.

MM3566AxxURE

1. PC Board of glass epoxy

Board size 100mm×100mm t=1.6mm Copper foil area 10%

Power dissipation 330mW Ta=25°C

2. JEDEC51-7 standard

Board size 114.3mm×76.2mm t=1.6mm Copper foil area 80%

Power dissipation 650mW Ta=25°C (It is reference value measured by JEDEC51-7 standard.)

It is recommended to layout the VIA for heat radiation in the GND pattern of reverse (of IC) when there is the GND pattern in the inner layer (in using multiplayer substrate).

By increasing these copper foil pattern area of PCB, Power dissipation improves.
