5.0 Interface Design

1. Firstly, put all pictures needed into the folder of BMP_FILE, convert them into BMP format and change picture names in proper sequence from 000.BMP. The operation can be completed with software of ACDSEE; see [Appendix I](#) for details in operation.

The picture files with names in proper sequence are shown in figure below:

BMP 000. bmp	83 KB	Windows Bitmap	240x117x24b
BMP 001. bmp	83 KB	Windows Bitmap	240x117x24b
BMP 002. bmp	83 KB	Windows Bitmap	240x117x24b
BMP 003. bmp	83 KB	Windows Bitmap	240x117x24b
BMP 004. bmp	83 KB	Windows Bitmap	240x117x24b
BMP 005. bmp	83 KB	Windows Bitmap	240x117x24b
BMP 006. bmp	282 KB	Windows Bitmap	240x400x24b

2. Execute batch processing command Bmptobin.exe and two files will be generated in the folder of BMP_DATA after execution, among which BMPDATA.BIN is the data file where all picture data are put successively and TABLE.BIN is the table file equivalent to index file; copy these two files into the folder virtualized by the module and then they are available for use.

3. If special character display is required by user, like Chinese or Japanese etc. The software attached in this module can be used for extracting font library; ([Only for Chinese version](#))

Revise the name of extracted font library file and copy it in to USB flash disk for application; the file name should be changed as HZK.BIN.

4. Note: this USB flash disk is a virtualized one; the file system is regulated for the convenience of application of this module and improvement of picture refreshing speed; please use FAT12 to format the USB flash disk; the limit number of files in root directory is 16 and generally there are only font library file, table file and data file; if other files need to be stored by user, it had better to make a new folder for storage of these files.

5. Press K1 key (reset key) on module after all files are copied into USB flash disk and then they are available for use.

6.0 Control Command

This module adopts alphabetic string to control all operations.

The command format begins with command word continued with parameter list in which parameters are separated by space and ends with a return character; pay attention that the return character is a must. When the command is executing, the busy pin is low, and the module can't receive new command, until the busy pin is high.

"CMD n1 n2.....Return"

The parameters n1, n2... in table below express a 16 -bit unsigned integer data and s1, s2...expresses alphabetic string.

Appendix I

Application of ACDSEE for classifying pictures

1. Collect materials for use into the folder of BMP_FILE; at the beginning, the pictures may be disordered and the processing of following steps is needed to make them in proper order for operation.

3. Sort the pictures successively beginning with 000.

5. Execute the batch file of BmptoBin.exe

6. After execution, there are two files generated in BMP_DATA, wherein BMPDATA.BIN is data file in which all picture data are put inside in order; TABLE.BIN is table file equivalent to index file. Copy these two files into the folder virtualized the module and then they are available for use.

2. Convert all files into BMP format.

4. Reorder the special picture sequence, for instance, the animation part and special font part must be continuous.
