

■ MBL8049N/E/H MBL8039N/E/H NMOS Single-Chip 8-Bit Microcomputer

Description

The Fujitsu MBL8049/MBL8039 is a totally self-contained 8-bit parallel one-chip microcomputer fabricated with an N-channel silicon gate MOS process.

The MBL8049 has a 2K × 8 ROM program memory, a 128 × 8 RAM data memory, 27 I/O ports, an 8-bit timer/counter and clock generator on chip. A single power supply of +5V is used. The MBL8039 is identical to the MBL8049 except without program memory. It can be used with external memory for system prototyping and preproduction systems.

The design is optimized for low cost, high performance applications because the MBL8049/MBL8039 is fabricated on a single silicon chip and can be used for applications that require additional expansion of ROMs, RAMs, I/O port, etc.

This microcomputer permits external program operation and a single-step operation mode. Low power applications are possible by using the stand-by mode feature.

The MBL8049/MBL8039 is packaged in a standard 40-pin DIP package and operation is guaranteed from 0°C to 70°C.

Features

- 8-bit Parallel Microcomputer
- 12-bit Addressing
- 96 Instructions: 70% Single Byte
- 1.875μs Cycle (E-Version)
2.5μs Cycle (N-Version)
All Instructions are 1 or 2 Cycles.
- 2K x 8 ROM (MBL8049 only)
128 x 8 RAM
27 I/O Lines
- Interval Timer/Event Counter
- Single Level Interrupt Capability
- Resident Clock Generator (External Frequency Source)
- External Input Capability
- Easily Expandable Memory and I/O
- 8 Level Stack
- External Program Mode Capability
- Low Power Stand-by Mode Capability
- Single +5V Power Supply
- N-channel Silicon Gate E/D MOS Process
- Standard 40-Pin DIP
- MBL8049: Compatible with Intel 8049
- MBL8039: Compatible with Intel 8039

Pin Assignment

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

*These pins are internally pulled up.

Pin Description

Pin No.	Pin Name	Symbol	Function
1	Sense	T_0	This pin has the following functions according to instructions. 1) Output of clock (ϕ 1) 2MHz at 6 MHz XTAL 2) Condition input for a Conditional Branch
2	Crystal 1	XTAL 1	This is an input terminal for the internal Clock Generator to be connected to a terminal of the external crystal. Also, this pin can be used as the input from an external clock source. Note: This input is not compatible with TTL levels.
3	Crystal 2	XTAL 2	This is an input terminal for the internal Clock Generator to be connected to the external crystal. Note: This input is not compatible with TTL level.
4	Reset	$\overline{\text{RESET}}$	This input forces the MPU to be reset or initialized. Note: This input is not compatible with TTL level.
5	Single Step	$\overline{\text{SS}}$	This input is used in conjunction with ALE for single step operation.
6	Interrupt	$\overline{\text{INT}}$	This input is used to request an external interrupt.
7	External Address	EA	When EA goes high while RESET is low, an external address (memory) can be used as the external program operation mode.
8	Read	$\overline{\text{RD}}$	This output is used as a strobe signal for an input of data from the data bus port (DB port). Also, it can be used as a read-enable signal when using an external data memory.
9	Program Store Enable	$\overline{\text{PSEN}}$	This output signal is generated at a fetch cycle in the external program operation mode. It is used as an enable signal for an external program memory.
10	Write	$\overline{\text{WR}}$	This output is a strobe signal for a data output from the DB port. Also, it can be used as a write-enable signal for an external data memory.
11	Address Latch Enable	ALE	This output signal is generated at the beginning of a fetch cycle both in the internal and external program memory operations. This output is used as a synchronizing signal with an external circuit and also, as a strobe signal for address outputs (A_0 thru A_7) of the DB port in the external program operation mode.
12 thru 19	Data Bus Port	DB0 thru DB7	These pins are used as a bidirectional 8-bit input/output port (DB port). When an external memory is used as a program memory or data memory, this port is used as an address bus (A_0 thru A_7) or data input/output port, respectively.
20	Power Supply	V_{SS}	This pin is used as the Ground (GND) terminal.
21 thru 24	Port 2	P20 thru P23	These are the lower four bits of a quasi-bidirectional input/output port (P2 port) which are used as address outputs (A_8 thru A_{11}) in a fetch cycle of the external program memory operation mode. When an expansion I/O instruction is executed, these are switched to an I/O expander bus for use with the MBL8243.

Pin Description
 (Continued)

Pin No.	Pin Name	Symbol	Function
25	Program	PROG	This output is used as a strobe signal for an I/O expander (MBL8243) when performing an expansion I/O instruction.
26	Power Supply	V _{DD}	This is used as the power supply terminal (+5V) for the built-in RAM.
27 thru 34	Port 1	P ₁₀ thru P ₁₇	This is a quasi-bidirectional input/output port (P1 port)
35 thru 38	Port 2	P ₂₄ thru P ₂₇	These are the upper four bits of the quasi-bidirectional input/output port 2 (P2).
39	Sense	T ₁	This pin has the following functions according to the instruction given: 1) Event Input for Event Counter 2) Condition Input for Conditional Branch
40	Power Supply	V _{CC}	This is used as the power supply terminal (+5V). In stand-by operation mode this terminal is connected to GND.

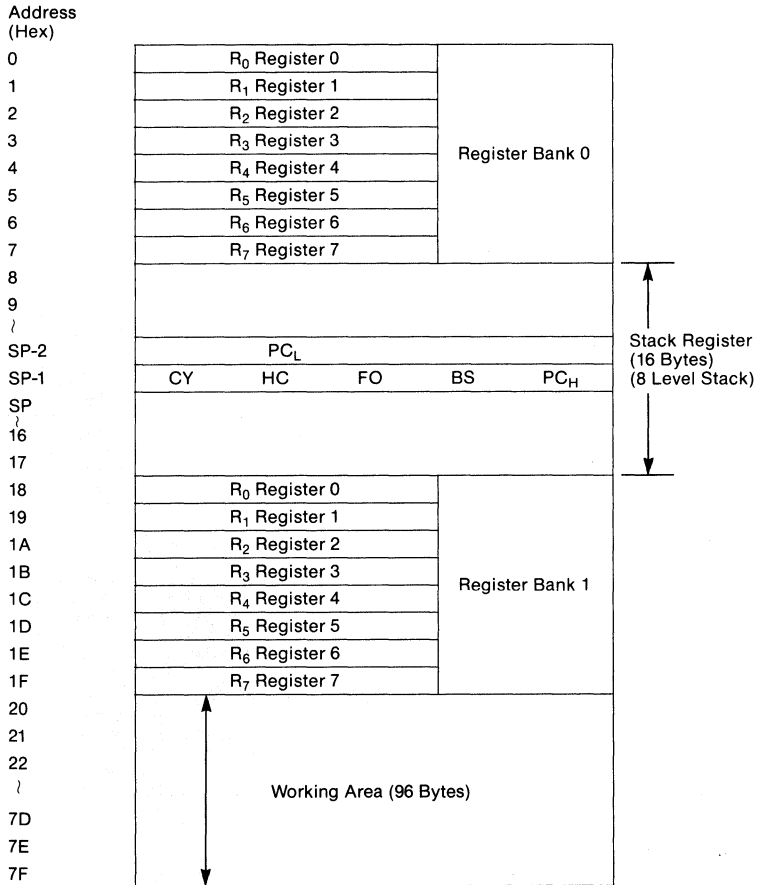

Functional Descriptions for Basic Blocks

Block Name	Function
Clock Generation Circuitry	A master clock signal within a frequency range of 1MHz to 6MHz is supplied from the built-in Clock Generator using an external crystal and capacitor network, or from an external signal source.
	The frequency of the master clock is divided through the 1/3 Frequency Divider to generate a state clock signal. Then, the frequency of the state clock is divided through the 1/5 Frequency Divider to generate a final cycle clock signal.
	The state clock can be transferred to the T ₀ terminal by an instruction.
I/O Port	The cycle clock is used for internal operations and is also available on the ALE terminal.
	Three bidirectional or quasi-bidirectional 8-bit I/O ports and three input terminals are provided for signal inputs and outputs.
Built-in ROM and RAM	Port 0 (Bus Port) and the lower 4 bits of Port 2 shown in the Block Diagram are used for access to external memories or I/O expanders.
	In the MBL8049, programs are stored in the built-in ROM (2K Bytes). Also, the contents in the ROM can be used as data for some instructions.
	The built-in RAM (128 bytes) is used for general register area, stack area and working area.
Program Counter	ROM is expandable up to a total of 4K Bytes with externally attached ROM by switching the memory bank.
	RAM is expandable by an additional 256 Bytes with externally attached RAM.
	MBL8039 does not have any built-in ROM. It uses external ROM for program storing.
	The program counter is an 11-bit register which indicates a fetch address of program memory and is incremented by every execution of an instruction.

**Functional Descriptions
 for Basic Blocks**
 (Continued)

Block Name	Function
Instruction Register	The Instruction Register is an 8-bit register which stores a fetched instruction in a fetch cycle.
Instruction Decoder	The Instruction Decoder decodes the instruction stored in the Instruction register and generates various control signals for both internal circuitry and external peripherals.
Arithmetic Logic Unit (ALU)	Various operations such as addition, subtraction, comparison, etc., are executed in the ALU. Operation to be executed is determined from the decoding of an instruction.
Interval Timer/Event Counter	<p>The Interval Timer/Event Counter is an 8-bit register which can be controlled by instruction execution. The interval timer mode or event counter mode can be designated by instruction execution, as well.</p> <p>This register is not initialized by the RESET signal. In the interval timer mode, the register can count up the frequency signal which is generated by dividing the cycle clock frequency by 32.</p> <p>When the source oscillation frequency is 6MHz, this enables the register to count a time interval of up to 20.48ms with resolution of 80μs.</p> <p>In this mode, the register generates an interrupt vector address (Address 07), if the register overflows from (FF)₁₆ to (00)₁₆.</p> <p>Even if an overflow occurs, the register can continue to count up. This enables the register to count a longer time interval by using proper software. In the event counter mode, the register counts on the falling edge of the T₁ input.</p> <p>In this mode, the features of the register other than the counting trigger are the same as those in the interval timer mode.</p> <p>Note: The T₁ input pulse has a 500ns Min. pulse width and a 7.5μs Min. cycle time at 6MHz of source oscillation.</p>
Status Register Including Stack Pointer	<p>The Status Register is an 8-bit register which consists of four bits for flags, three bits for the Stack Pointer and an unused bit.</p> <p>The flag bits indicate the status of the MPU.</p> <p>The Stack Pointer indicates with its three bits, an address in the stack area to be used in the next subroutine call or interrupt.</p>

Resident Data Memory Map (RAM)

Status Register (PSW)

The Status Register is an 8-bit register configured as shown in the following figure. The upper four bits are used for flags to indicate the status of the MPU, and when a sub-routine call or an interrupt occurs, the contents of the program counter is transferred to one of the 8 register pairs of the Stack Register as determined by the lower three bits of the Status Register. The remaining one bit is an unused bit.

Flags

CY (Carry): When an overflow occurs in the Accumulator during an operation in the ALU, "1" is set in this bit.

HC (Half Carry): When an overflow occurs from Bit 3 to Bit 4 in the accumulator as a result of an addition, "1" is set in this bit.

F₀ (User Flag): This flag can be controlled as a user flag by the proper instruction.

BS (Bank select): This flag can be controlled to select a Register Bank by an instruction. When BS = 0, the Register Bank 0 is selected. When BS = 1, the Register Bank 1 is selected.

Stack Register (8 Level Capability)

The Stack Register occupies 16-bytes of memory within the on-board RAM. It is configured into eight levels of two bytes each as shown in Figure 1.

Stack Pointer (SP)

In Figure 1., "SP" indicates the stack level to be used for the next sub-routine call or interrupt. The Stack Pointer generates one of eight address codes and resides in the lower three bits of the status register.

$$SP = 00001SP_2SP_1SP_0$$

Program Counter (PC)

In Figure 1., "PC_n" indicates the individual bit contents of each of the Program Counter bits.

Interrupt Operation

There are two interrupt modes, external interrupts, and timer/counter interrupts.

When either interrupt occurs, an interrupt flag is set and upon completion of the executing instruction the interrupt is processed.

Interrupt processing is as follows:

1. The contents of the Status Register and Program Counter are saved on the Stack.
2. Program flow jumps to the address specified at address three (3) for external interrupts and address seven (7) for timer/counter interrupts.

3. Completion of the interrupt processing occurs upon execution of the RETR (Return and Restore Status) instruction.

4. The contents of the program counter and status register are restored from the stack, the interrupt flag is reset to be ready for the next interrupt, and program execution continues from where it left off.

Timer/counter interrupts occur when the overflow flag is set as a result of an overflow from the Timer/Counter.

External interrupts occur when a low level input is applied to the "INT" input.

External interrupts have priority over Timer/Counter interrupts, so if both interrupts occur at the same time the external interrupt will be processed first. After completion of the external interrupt and resetting of the interrupt flag the Timer/Counter interrupt will be processed.

Instructions

All instructions are either one or two bytes long and execute in one or two cycles. Addressing modes are classified into direct, expanded, indirect, immediate and implied.

Instruction Mode

- 1) 1 Byte Instruction

Implied Addressing Mode

Register Indirect Addressing Mode

Register Direct Addressing Mode

- 2) 2 Byte Instruction

Immediate Addressing Mode

Expanded Addressing Mode

A_L: Lower 8 Bits of Address
A_H: A₈, A₉, A₁₀ of Address
MBF: Memory Bank Flag

Instruction Set Summary
 (Continued)

OP Code of Register Access (Table 1)

Mnemonic	Rr	R0	R1	R2	R3	R4	R5	R6	R7
INC Rr		18	19	1A	1B	1C	1D	1E	1F
XCH A,Rr		28	29	2A	2B	2C	2D	2E	2F
ORL A,Rr		48	49	4A	4B	4C	4D	4E	4F
ANL A,Rr		58	59	5A	5B	5C	5D	5E	5F
ADD A,Rr		68	69	6A	6B	6C	6D	6E	6F
ADDC A,Rr		78	79	7A	7B	7C	7D	7E	7F
MOV Rr,A		A8	A9	AA	AB	AC	AD	AE	AF
MOV Rr,#data		B8	B9	BA	BB	BC	BD	BE	BF
DEC Rr		C8	C9	CA	CB	CC	CD	CE	CF
XRL A,Rr		D8	D9	DA	DB	DC	DD	DE	DF
DJNZ Rr,M		E8	E9	EA	EB	EC	ED	EE	EF
MOV A,Rr		F8	F9	FA	FB	FC	FD	FE	FF

OP Code of Expander (Table 2)

Mnemonic	PP	P4	P5	P6	P7
MOVD A,Pp	0C	0D	0E	0F	
MOVD Pp,A	3C	3D	3E	3F	
ORLD Pp,A	8C	8D	8E	8F	
ANLD Pp,A	9C	9D	9E	9F	

OP Code of JMP, CALL, JB_r (Table 3)

A_L: Address A₇ to A₀
 A_H: Address A₁₀, A₉, A₈
 B_r: r-th Bit on Accumulator

#: Immediate data
H: Higher 4 bits
L: Lower 4 bits

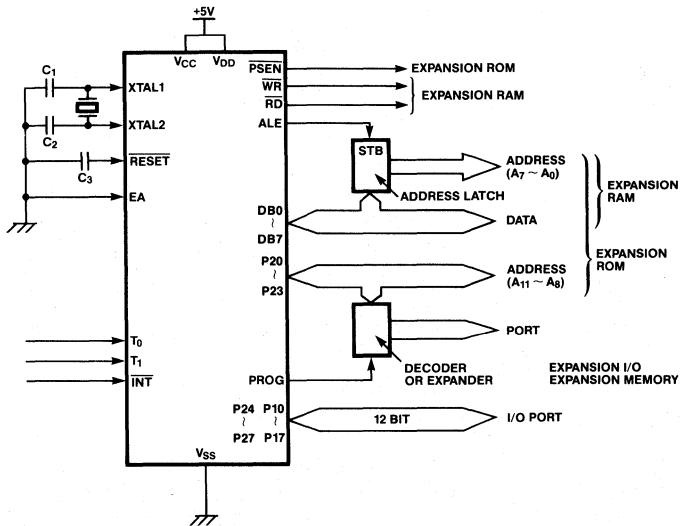

Typical Applications

(1) Stand Alone System

(2) Expanded System

Absolute Maximum Ratings†

Parameter	Symbol	Value	Unit
Supply Voltage	V_{CC}, V_{DD}	-0.3 to +7.0	V
Input Voltage	V_{IN}	-0.3 to +7.0	V
Operating Temperature	T_A	0 to +70	°C
Storage Temperature	T_{stg}	-55 to +150	°C
Power Dissipation	P_D	1.5	W

†Permanent device damage may occur if the ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Recommended Operating Conditions

Parameter	Symbol	Value	Unit
Supply Voltage	V_{CC}, V_{DD}	+5.0 ±10%	V
	V_{SS}	0	V
Operating Temperature	T_A	0 to +70	°C

DC Characteristics

($T_A = 0^\circ\text{C}$ to $+70^\circ\text{C}$, $V_{CC} = V_{DD}$
 $= 5.0\text{V} \pm 10\%$, $V_{SS} = 0\text{V}$)

Parameter	Symbol	Test Conditions	Value		Unit
			Min.	Max.	
Input Low Voltage	All Except XTAL1, 2, RESET	V_{IL}	-0.3	0.8	V
	XTAL1,2, RESET	V_{IL1}	-0.3	0.6	V
Input High Voltage	All Except XTAL1, 2, RESET	V_{IH}	2.0	V_{CC}	V
	XTAL1,2, RESET	V_{IH1}	3.8	V_{CC}	V
Output Low Voltage	BUS	V_{OL}	$I_{OL} = 2.0\text{mA}$	0.45	V
	RD, WR, PSEN, ALE	V_{OL1}	$I_{OL} = 2.0\text{mA}$	0.45	V
	PROG	V_{OL2}	$I_{OL} = 1.0\text{mA}$	0.45	V
	Other outputs	V_{OL3}	$I_{OL} = 1.6\text{mA}$	0.45	V
Output High Voltage	BUS	V_{OH}	$I_{OH} = -400\mu\text{A}$	2.4	V
	RD, WR, PSEN, ALE	V_{OH1}	$I_{OH} = -100\mu\text{A}$	2.4	V
	Other Outputs	V_{OH2}	$I_{OH} = -50\mu\text{A}$	2.4	V
Input Leakage Current	T_1, INT	I_{IL}	$V_{SS} \leq V_{IN} \leq V_{CC}$	±10	μA
	P10-P17, P20-P27, EA, SS	I_{IL1}	$V_{SS} + 0.45\text{V} \leq V_{IN} \leq V_{CC}$	-500	μA
Output Leakage Current	BUS, T_0 (High-Impedance)	I_{OL}	$V_{SS} + 0.45\text{V} \leq V_{IN} \leq V_{CC}$	±10	μA
V_{DD} Supply Current	MBL8049/39N/E	I_{DD}		30	mA
	MBL8049/39H			50	mA
Total Supply Current	MBL8049/39N/E	$I_{DD} + I_{CC}$		150	mA
	MBL8049/39H			170	mA

2

AC Characteristics*
($T_A = 0^\circ\text{C}$ to $+70^\circ\text{C}$, $V_{CC} = V_{DD}$
 $= 5.0\text{V} \pm 10\%$, $V_{SS} = 0\text{V}$)

Parameter	Symbol	H-Version		E-Version		N-Version		Unit
		Min.	Max.	Min.	Max.	Min.	Max.	
ALE Pulse Width	t_{LL}	150		260		410		ns
Address Setup Time (to ALE \dagger)	t_{AL}	70		140		230		ns
Address Hold Time (from ALE \dagger)	t_{LA}	50		80		120		ns
Control Pulse Width (RD, WR)	t_{CC1}	480		730		1050		ns
Control Pulse Width (PSEN)	t_{CC2}	350		550		800		ns
Data Setup Time (before WR \dagger)	t_{DW}	390		610		880		ns
Data Hold Time (after WR \dagger)**	t_{WD}	40		80		120		ns
Data Hold Time (after RD \dagger , PSEN \dagger)	t_{DR}	0	110	0	160	0	220	ns
Data Delayed Time (RD \dagger to data in)	t_{RD1}		350		550		800	ns
Data Delayed Time (PSEN \dagger to data in)	t_{RD2}		210		360		550	ns
Address Setup Time (to WR \dagger)	t_{AW}	310		480		680		ns
Address Setup Time (RD, to data in)	t_{AD1}		760		1130		1590	ns
Address Setup Time (PSEN, to data in)	t_{AD2}		480		750		1090	ns
Address Floating Time (to RD \dagger , WR \dagger)	t_{AFC1}	140		210		290		ns
Address Floating Time (to PSEN \dagger)	t_{AFC2}	10		20		40		ns
RD, WR Output Time (from ALE \dagger)	t_{LAFC1}	200		300		420		ns
PSEN Output Time (from ALE \dagger)	t_{LAFC2}	60		110		170		ns
ALE Output Time (from RD \dagger , WR \dagger , PROG \dagger)	t_{CA1}	50		80		120		ns
ALE Output Time (from PSEN \dagger)	t_{CA2}	320		460		620		ns
Port Control Setup Before Falling Edge of PROG Time	t_{CP}	100		170		250		ns
Port Control Hold After Falling Edge of PROG Time	t_{PC}	160		300		460		ns
PROG Time P2 Input Must Be Valid	t_{PR}		700		1000		1380	ns
P2 Input Data Hold Time (after PROG \dagger)	t_{PF}	0	140	0	190	0	250	ns
Output Data Setup Time (to PROG \dagger)	t_{DP}	400		600		850		ns
Output Data Hold Time (after PROG \dagger)	t_{PD}	90		130		200		ns
PROG Pulse Width	t_{PP}	700		1060		1500		ns
Port2 I/O Data Setup Time (to ALE \dagger)	t_{PL}	160		300		460		ns
Port2 I/O Data Hold Time (from ALE \dagger)	t_{LP}	40		60		80		ns
Port Data Output Time (from ALE \dagger)	t_{PV}		510		660		850	ns
Cycle Time***	t_{CY}	1.36		1.875		2.5		μs
T_0 Output Cycle Time	t_{OPRR}	270		370		500		ns

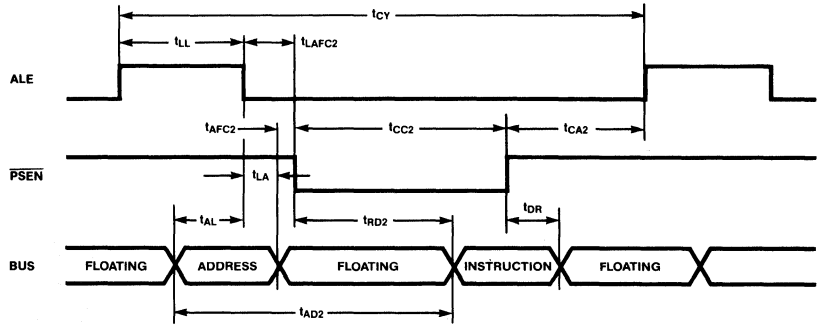

*: 6MHz XTAL (N-Version), 8MHz XTAL (E-Version), 11MHz XTAL (H-Version) Load Conditions: BUS: $C_L = 150\text{pF}$; Other Outputs $C_L = 80\text{pF}$.

** : Load Conditions $C_L = 20\text{pF}$, High Impedance

*** : $t_{CY} = 2.5\mu\text{s}$ (6MHz XTAL N-Version), $t_{CY} = 1.875\mu\text{s}$ (8MHz XTAL E-Version), $t_{CY} = 1.36\mu\text{s}$ (11MHz XTAL H-Version)
