

SM320VC5507-EP

Fixed-Point Digital Signal Processor

Data Manual

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

Literature Number: SPRS613
September 2009

Fixed-Point Digital Signal Processor

Check for Samples: [SM320VC5507-EP](#)

1 Features

- **High-Performance, Low-Power, Fixed-Point SMS320C5507 Digital Signal Processor**
 - 9.26-, 6.95-, 5-ns Instruction Cycle Time
 - 108-, 144-, 200-MHz Clock Rate
 - One/Two Instruction(s) Executed per Cycle
 - Dual Multipliers (Up to 400 Million Multiply-Accumulates per Second (MMACS))
 - Two Arithmetic/Logic Units (ALUs)
 - Three Internal Data/Operand Read Buses and Two Internal Data/Operand Write Buses
 - **64K x 16-Bit On-Chip RAM, Composed of:**
 - 64K Bytes of Dual-Access RAM (DARAM) 8 Blocks of 4K x 16-Bit
 - 64K Bytes of Single-Access RAM (SARAM) 8 Blocks of 4K x 16-Bit
 - **64K Bytes of One-Wait-State On-Chip ROM (32K x 16-Bit)**
 - **8M x 16-Bit Maximum Addressable External Memory Space (Synchronous DRAM)**
 - **16-Bit External Parallel Bus Memory Supporting Either:**
 - **External Memory Interface (EMIF) With GPIO Capabilities and Glueless Interface to:**
 - Asynchronous Static RAM (SRAM)
 - Asynchronous EPROM
 - Synchronous DRAM (SDRAM)
 - **16-Bit Parallel Enhanced Host-Port Interface (EHPI) With GPIO Capabilities**
 - **Programmable Low-Power Control of Six Device Functional Domains**
 - **On-Chip Scan-Based Emulation Logic**
 - **On-Chip Peripherals**
 - Two 20-Bit Timers
 - Watchdog Timer
 - Six-Channel Direct Memory Access (DMA) Controller
 - Three Multichannel Buffered Serial Ports (McBSPs)
 - Programmable Phase-Locked Loop Clock Generator
 - Seven (LQFP) or Eight (BGA) General-Purpose I/O (GPIO) Pins and a General-Purpose Output Pin (XF)
 - USB Full-Speed (12 Mbps) Slave Port Supporting Bulk, Interrupt and Isochronous Transfers
 - Inter-Integrated Circuit (I²C) Multi-Master and Slave Interface
 - Real-Time Clock (RTC) With Crystal Input, Separate Clock Domain, Separate Power Supply
 - 4-Channel (BGA) or 2-Channel (LQFP) 10-Bit Successive Approximation A/D
 - **IEEE Std 1149.1⁽¹⁾ (JTAG) Boundary Scan Logic**
 - **Packages:**
 - 144-Terminal Low-Profile Quad Flatpack (LQFP) (PGE Suffix)
 - **1.2-V Core (108 MHz), 2.7-V – 3.6-V I/Os**
 - **1.35-V Core (144 MHz), 2.7-V – 3.6-V I/Os**
 - **1.6-V Core (200 MHz), 2.7-V – 3.6-V I/Os**
- (1) IEEE Standard 1149.1-1990 Standard-Test-Access Port and Boundary Scan Architecture.

1.1 SUPPORTS DEFENSE, AEROSPACE, AND MEDICAL APPLICATIONS

- **Controlled Baseline**
- **One Assembly/Test Site**
- **One Fabrication Site**
- **Available in Military (–55°C/125°C) Temperature Range⁽²⁾**
- **Extended Product Life Cycle**
- **Extended Product-Change Notification**
- **Product Traceability**

(2) Additional temperature ranges are available - contact factory

2 Introduction

This section describes the main features of the SM320VC5507, lists the pin assignments, and describes the function of each pin. This data manual also provides a detailed description section, electrical specifications, parameter measurement information, and mechanical data about the available packaging.

NOTE

This data manual is designed to be used in conjunction with the TMS320C55x DSP Functional Overview (literature number [SPRU312](#)), the TMS320C55x DSP CPU Reference Guide (literature number [SPRU371](#)), and the TMS320C55x DSP Peripherals Overview Reference Guide (literature number [SPRU317](#)).

2.1 Description

The SM320VC5507 fixed-point digital signal processor (DSP) is based on the SMS320C55x DSP generation CPU processor core. The C55x™ DSP architecture achieves high performance and low power through increased parallelism and total focus on reduction in power dissipation. The CPU supports an internal bus structure that is composed of one program bus, three data read buses, two data write buses, and additional buses dedicated to peripheral and DMA activity. These buses provide the ability to perform up to three data reads and two data writes in a single cycle. In parallel, the DMA controller can perform up to two data transfers per cycle independent of the CPU activity.

The C55x CPU provides two multiply-accumulate (MAC) units, each capable of 17-bit x 17-bit multiplication in a single cycle. A central 40-bit arithmetic/logic unit (ALU) is supported by an additional 16-bit ALU. Use of the ALUs is under instruction set control, providing the ability to optimize parallel activity and power consumption. These resources are managed in the Address Unit (AU) and Data Unit (DU) of the C55x CPU.

The C55x DSP generation supports a variable byte width instruction set for improved code density. The Instruction Unit (IU) performs 32-bit program fetches from internal or external memory and queues instructions for the Program Unit (PU). The Program Unit decodes the instructions, directs tasks to AU and DU resources, and manages the fully protected pipeline. Predictive branching capability avoids pipeline flushes on execution of conditional instructions.

The 128K bytes of on-chip memory on 5507 is sufficient for many hand-held appliances, portable GPS systems, wireless speaker phones, portable PDAs, and gaming devices. Many of these appliances typically require 64K bytes or more on-chip memory but less than 128K bytes of memory, and need to operate in standby mode for more than 60% to 70% of time. For the applications which require more than 128K bytes of on-chip memory but less than 256K bytes of on-chip memory, Texas Instruments (TI) offers the TMS320VC5509A device, which is based on the TMS320C55x DSP core.

The general-purpose input and output functions and the 10-bit A/D provide sufficient pins for status, interrupts, and bit I/O for LCDs, keyboards, and media interfaces. The parallel interface operates in two modes, either as a slave to a microcontroller using the HPI port or as a parallel media interface using the asynchronous EMIF. Serial media is supported through three McBSPs.

The 5507 peripheral set includes an external memory interface (EMIF) that provides glueless access to asynchronous memories like EPROM and SRAM, as well as to high-speed, high-density memories such as synchronous DRAM. Additional peripherals include Universal Serial Bus (USB), real-time clock, watchdog timer, and I²C multi-master and slave interface. Three full-duplex multichannel buffered serial ports (McBSPs) provide glueless interface to a variety of industry-standard serial devices, and multichannel communication with up to 128 separately enabled channels. The enhanced host-port interface (HPI) is a 16-bit parallel interface used to provide host processor access to 32K bytes of internal

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

memory on the 5507. The HPI can be configured in either multiplexed or non-multiplexed mode to provide glueless interface to a wide variety of host processors. The DMA controller provides data movement for six independent channel contexts without CPU intervention, providing DMA throughput of up to two 16-bit words per cycle. Two general-purpose timers, up to eight dedicated general-purpose I/O (GPIO) pins, and digital phase-locked loop (DPLL) clock generation are also included.

The 5507 is supported by the industry's award-winning eXpressDSP™, Code Composer Studio™ Integrated Development Environment (IDE), DSP/BIOS™, Texas Instruments' algorithm standard, and the industry's largest third-party network. The Code Composer Studio IDE features code generation tools including a C Compiler and Visual Linker, simulator, RTDX™, XDS510™ emulation device drivers, and evaluation modules. The 5507 is also supported by the C55x DSP Library which features more than 50 foundational software kernels (FIR filters, IIR filters, FFTs, and various math functions) as well as chip and board support libraries.

2.2 Pin Assignments

The SM320VC5507PGE 144-pin low-profile quad flatpack (LQFP) pin assignments are shown in Figure 2-1 and is used in conjunction with Table 2-1 to locate signal names and pin numbers.

DV_{DD} is the power supply for the I/O pins while CV_{DD} is the power supply for the core. V_{SS} is the ground for both the I/O pins and the core. RCV_{DD} and RDV_{DD} are RTC module core and I/O supply, respectively. USBV_{DD} is the USB module I/O (DP, DN, and PU) supply. ADV_{DD} is the power supply for the digital portion of the ADC. AV_{DD} is the power supply for the analog part of the ADC. ADV_{SS} is the ground pin for the digital portion of the ADC. AV_{SS} is the ground pin for the analog part of the ADC. USBPLL_{V_{DD}} and USBPLL_{V_{SS}} are the dedicated supply and ground pins for the USB PLL, respectively.

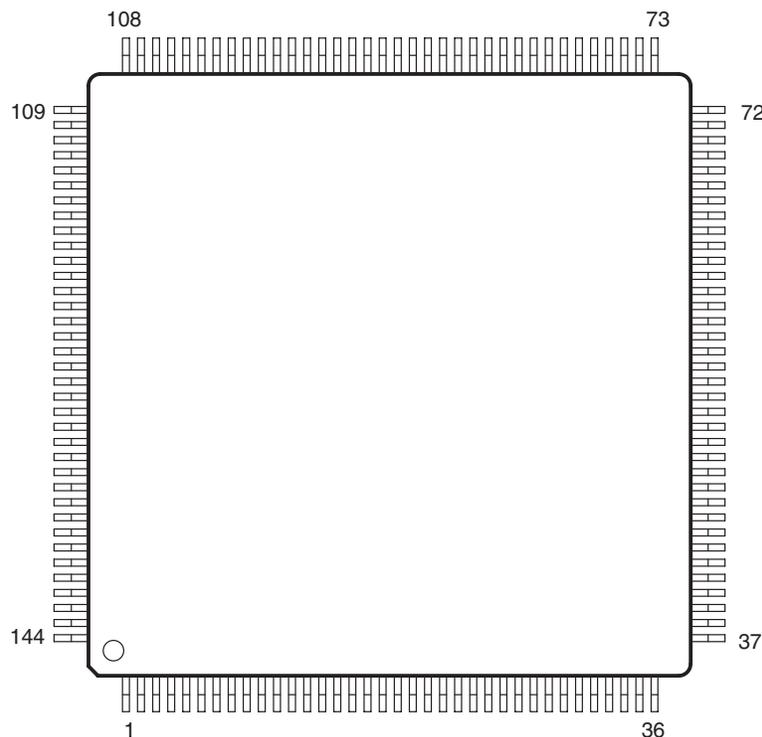

Figure 2-1. 144-Pin PGE Low-Profile Quad Flatpack (Top View)

Table 2-1. Pin Assignments for the PGE Package

| PIN NO. | SIGNAL NAME | PIN NO. | SIGNAL NAME | PIN NO. | SIGNAL NAME | PIN NO. | SIGNAL NAME |
|---------|--------------------|---------|------------------|---------|-------------------------------|---------|-------------------|
| 1 | V _{SS} | 37 | V _{SS} | 73 | V _{SS} | 109 | RDV _{DD} |
| 2 | PU | 38 | A13 | 74 | D12 | 110 | RCV _{DD} |
| 3 | DP | 39 | A12 | 75 | D13 | 111 | RTCINX2 |
| 4 | DN | 40 | A11 | 76 | D14 | 112 | RTCINX1 |
| 5 | USBV _{DD} | 41 | CV _{DD} | 77 | D15 | 113 | V _{SS} |

2.3 Signal Descriptions

Table 2-2 lists each signal, function, and operating mode(s) grouped by function. See Section 2.2 for pin locations.

Table 2-2. Signal Descriptions

| TERMINAL NAME | MULTIPLEXED SIGNAL NAME | I/O/Z ⁽¹⁾ | FUNCTION | BK ⁽²⁾ | RESET CONDITION |
|---------------------|-------------------------|----------------------|---|-------------------|---|
| PARALLEL BUS | | | | | |
| A[13:0] | | I/O/Z | A subset of the parallel address bus A13–A0 of the C55x DSP core bonded to external pins. These pins serve in one of three functions: HPI address bus (HPI.HA[13:0]), EMIF address bus (EMIF.A[13:0]), or general-purpose I/O (GPIO.A[13:0]). The initial state of these pins depends on the GPIO0 pin. See Section 3.6.1 for more information. The address bus has a bus holder feature that eliminates passive component requirement and the power dissipation associated with them. The bus holders keep the address bus at the previous logic level when the bus goes into a high-impedance state. | | |
| | HPI.HA[13:0] | I | HPI address bus. HPI.HA[13:0] is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 10. This setting enables the HPI in non-multiplexed mode. HPI.HA[13:0] provides DSP internal memory access to host. In non-multiplexed mode, these signals are driven by an external host as address lines. | BK | GPIO0 = 1: Output, EMIF.A[13:0] GPIO0 = 0: Input, HPI.HA[13:0] |
| | EMIF.A[13:0] | O/Z | EMIF address bus. EMIF.A[13:0] is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 01. This setting enables the full EMIF mode and the EMIF drives the parallel port address bus. The internal A[14] address is exclusive-ORed with internal A[0] address and the result is routed to the A[0] pin. | | |
| | GPIO.A[13:0] | I/O/Z | General-purpose I/O address bus. GPIO.A[13:0] is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 11. This setting enables the HPI in multiplexed mode with the Parallel Port GPIO register controlling the parallel port address bus. GPIO is also selected when the Parallel Port Mode bit field is 00, enabling the Data EMIF mode. | | |

(1) I = Input, O = Output, S = Supply, Hi-Z = High-impedance

(2) BK = bus keeper (the bus keeper maintains the previous voltage level during reset or while the output pin is not driven), PU = pullup, PD = pulldown, H = hysteresis input buffer, FS = fail-safe buffer

Table 2-2. Signal Descriptions (continued)

| TERMINAL NAME | MULTIPLEXED SIGNAL NAME | I/O/Z ⁽¹⁾ | FUNCTION | BK ⁽²⁾ | RESET CONDITION |
|---------------|-------------------------|----------------------|--|-------------------|--|
| D[15:0] | | I/O/Z | A subset of the parallel bidirectional data bus D31–D0 of the C55x DSP core. These pins serve in one of two functions: EMIF data bus (EMIF.D[15:0]) or HPI data bus (HPI.HD[15:0]). The initial state of these pins depends on the GPIO0 pin. See Section 3.6.1 for more information. The data bus includes bus keepers to reduce the static power dissipation caused by floating, unused pins. This eliminates the need for external bias resistors on unused pins. When the data bus is not being driven by the CPU, the bus keepers keep the pins at the logic level that was most recently driven. (The data bus keepers are enabled at reset, and can be enabled/disabled under software control.) | BK | GPIO0 = 1: Input, EMIF.D[15:0] GPIO0 = 0: Input, HPI.HD[15:0] |
| | EMIF.D[15:0] | I/O/Z | EMIF data bus. EMIF.D[15:0] is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 00 or 01. | | |
| | HPI.HD[15:0] | I/O/Z | HPI data bus. HPI.HD[15:0] is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 10 or 11. | | |
| C0 | | I/O/Z | EMIF asynchronous memory read enable or general-purpose IO8. This pin serves in one of two functions: EMIF asynchronous memory read enable (EMIF.ARE) or general-purpose IO8 (GPIO8). The initial state of this pin depends on the GPIO0 pin. See Section 3.6.1 for more information. | BK | GPIO0 = 1: Output, EMIF.ARE GPIO0 = 0: Input, GPIO8 |
| | EMIF.ARE | O/Z | Active-low EMIF asynchronous memory read enable. EMIF.ARE is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 00 or 01. | | |
| | GPIO8 | I/O/Z | General-purpose IO8. GPIO8 is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 10 or 11. | | |
| C1 | | O/Z | EMIF asynchronous memory output enable or HPI interrupt output. This pin serves in one of two functions: EMIF asynchronous memory output enable (EMIF.AOE) or HPI interrupt output (HPI.HINT). The initial state of this pin depends on the GPIO0 pin. See Section 3.6.1 for more information. | BK | GPIO0 = 1: Output, EMIF.AOE GPIO0 = 0: Input, HPI.HINT |
| | EMIF.AOE | O/Z | Active-low asynchronous memory output enable. EMIF.AOE is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 00 or 01. | | |
| | HPI.HINT | O/Z | Active-low HPI interrupt output. HPI.HINT is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 10 or 11. | | |

Table 2-2. Signal Descriptions (continued)

| TERMINAL NAME | MULTIPLEXED SIGNAL NAME | I/O/Z ⁽¹⁾ | FUNCTION | BK ⁽²⁾ | RESET CONDITION |
|---------------|-------------------------------|----------------------|---|-------------------|--|
| C2 | | I/O/Z | EMIF asynchronous memory write enable or HPI read/write. This pin serves in one of two functions: EMIF asynchronous memory write enable (EMIF. $\overline{\text{AWE}}$) or HPI read/write (HPI.HR $\overline{\text{W}}$). The initial state of this pin depends on the GPIO0 pin. See Section 3.6.1 for more information. | BK | GPIO0 = 1: Output, EMIF. $\overline{\text{AWE}}$ GPIO0 = 0: Input, HPI.HR $\overline{\text{W}}$ |
| | EMIF. $\overline{\text{AWE}}$ | O/Z | Active-low EMIF asynchronous memory write enable. EMIF. $\overline{\text{AWE}}$ is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 00 or 01. | | |
| | HPI.HR $\overline{\text{W}}$ | I | HPI read/write. HPI.HR $\overline{\text{W}}$ is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 10 or 11. HPI.HR/W controls the direction of the HPI transfer. | | |
| C3 | | I/O/Z | EMIF data ready input or HPI ready output. This pin serves in one of two functions: EMIF data ready input (EMIF.ARDY) or HPI ready output (HPI.HRDY). The initial state of this pin depends on the GPIO0 pin. See Section 3.6.1 for more information. | H | GPIO0 = 1: Input, EMIF.ARDY GPIO0 = 0: Output, HPI.HRDY |
| | EMIF.ARDY | I | EMIF data ready input. Used to insert wait states for slow memories. EMIF.ARDY is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 00 or 01. When this pin is used as ARDY, an external 2.2 k Ω | | |
| | HPI.HRDY | O | HPI ready output. HPI.HRDY is selected when the Parallel Port Mode bit field of the External Bus Selection Register is 10 or 11. | | |
| C4 | | I/O/Z | EMIF chip select for memory space CE0 or general-purpose IO9. This pin serves in one of two functions: EMIF chip select for memory space CE0 (EMIF. $\overline{\text{CE0}}$) or general-purpose IO9 (GPIO9). The initial state of this pin depends on the GPIO0 pin. See Section 3.6.1 for more information. | BK | GPIO0 = 1: Output, EMIF. $\overline{\text{CE0}}$ GPIO0 = 0: Input, GPIO9 |
| | EMIF. $\overline{\text{CE0}}$ | O/Z | Active-low EMIF chip select for memory space CE0. EMIF. $\overline{\text{CE0}}$ is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01. | | |
| | GPIO9 | I/O/Z | General-purpose IO9. GPIO9 is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 10 or 11. | | |
| C5 | | I/O/Z | EMIF chip select for memory space CE1 or general-purpose IO10. This pin serves in one of two functions: EMIF chip-select for memory space CE1 (EMIF. $\overline{\text{CE1}}$) or general-purpose IO10 (GPIO10). The initial state of this pin depends on the GPIO0 pin. See Section 3.6.1 for more information. | BK | GPIO0 = 1: Output, EMIF. $\overline{\text{CE1}}$ GPIO0 = 0: Input, GPIO10 |
| | EMIF. $\overline{\text{CE1}}$ | O/Z | Active-low EMIF chip select for memory space CE1. EMIF. $\overline{\text{CE1}}$ is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01. | | |
| | GPIO10 | I/O/Z | General-purpose IO10. GPIO10 is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 10 or 11. | | |

Table 2-2. Signal Descriptions (continued)

| TERMINAL NAME | MULTIPLEXED SIGNAL NAME | I/O/Z ⁽¹⁾ | FUNCTION | BK ⁽²⁾ | RESET CONDITION |
|---------------|-------------------------------|----------------------|---|-------------------|--|
| C6 | | I/O/Z | EMIF chip select for memory space CE2 or HPI control input 0. This pin serves in one of two functions: EMIF chip-select for memory space CE2 (EMIF. $\overline{\text{CE2}}$) or HPI control input 0 (HPI.HCNTL0). The initial state of this pin depends on the GPIO0 pin. See Section 3.6.1 for more information. | BK | GPIO0 = 1: Output, EMIF. $\overline{\text{CE2}}$ GPIO0 = 0: Input, HPI.HCNTL0 |
| | EMIF. $\overline{\text{CE2}}$ | O/Z | Active-low EMIF chip select for memory space CE2. EMIF. $\overline{\text{CE2}}$ is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01. | | |
| | HPI.HCNTL0 | I | HPI control input 0. This pin, in conjunction with HPI.HCNTL1, selects a host access to one of the three HPI registers. HPI.HCNTL0 is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 10 or 11. | | |
| C7 | | I/O/Z | EMIF chip select for memory space CE3, general-purpose IO11, or HPI control input 1. This pin serves in one of three functions: EMIF chip-select for memory space CE3 (EMIF. $\overline{\text{CE3}}$), general-purpose IO11 (GPIO11), or HPI control input 1 (HPI.HCNTL1). The initial state of this pin depends on the GPIO0 pin. See Section 3.6.1 for more information. | BK | GPIO0 = 1: Output, EMIF. $\overline{\text{CE3}}$ GPIO0 = 0: Input, HPI.HCNTL1 |
| | EMIF. $\overline{\text{CE3}}$ | O/Z | Active-low EMIF chip select for memory space CE3. EMIF. $\overline{\text{CE3}}$ is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01. | | |
| | GPIO11 | I/O/Z | General-purpose IO11. GPIO11 is selected when the Parallel Port Mode bit field is set to 10. | | |
| | HPI.HCNTL1 | I | HPI control input 1. This pin, in conjunction with HPI.HCNTL0, selects a host access to one of the three HPI registers. The HPI.HCNTL1 mode is selected when the Parallel Port Mode bit field is set to 11. | | |
| C8 | | I/O/Z | EMIF byte enable 0 control or HPI byte identification. This pin serves in one of two functions: EMIF byte enable 0 control (EMIF. $\overline{\text{BE0}}$) or HPI byte identification (HPI.HBE0). The initial state of this pin depends on the GPIO0 pin. See Section 3.6.1 for more information. | BK | GPIO0 = 1: Output, EMIF. $\overline{\text{BE0}}$ GPIO0 = 0: Input, HPI.HBE0 |
| | EMIF. $\overline{\text{BE0}}$ | O/Z | Active-low EMIF byte enable 0 control. EMIF. $\overline{\text{BE0}}$ is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01. | | |
| | HPI.HBE0 | I | HPI byte identification. This pin, in conjunction with HPI.HBE1, identifies the first or second byte of the transfer. HPI.HBE0 is selected when the Parallel Port Mode bit field is set to 10 or 11. | | |

Table 2-2. Signal Descriptions (continued)

| TERMINAL NAME | MULTIPLEXED SIGNAL NAME | I/O/Z ⁽¹⁾ | FUNCTION | BK ⁽²⁾ | RESET CONDITION |
|---------------|-------------------------|----------------------|--|-------------------|--|
| C9 | | I/O/Z | EMIF byte enable 1 control or HPI byte identification. This pin serves in one of two functions: EMIF byte enable 1 control (EMIF.BE1) or HPI byte identification (HPI.HBE1). The initial state of this pin depends on the GPIO0 pin. See Section 3.6.1 for more information. | BK | GPIO0 = 1: Output, EMIF.BE1 GPIO0 = 0: Input, HPI.HBE1 |
| | EMIF.BE1 | O/Z | Active-low EMIF byte enable 1 control. EMIF.BE1 is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01. | | |
| | HPI.HBE1 | I | HPI byte identification. This pin, in conjunction with HPI.HBE0, identifies the first or second byte of the transfer. HPI.HBE1 is selected when the Parallel Port Mode bit field is set to 10 or 11. | | |
| C10 | | I/O/Z | EMIF SDRAM row strobe, HPI address strobe, or general-purpose IO12. This pin serves in one of three functions: EMIF SDRAM row strobe (EMIF.SDRAS), HPI address strobe (HPI.HAS), or general-purpose IO12 (GPIO12). The initial state of this pin depends on the GPIO0 pin. See Section 3.6.1 for more information. | BK | GPIO0 = 1: Output, EMIF.SDRAS GPIO0 = 0: Input, HPI.HAS |
| | EMIF.SDRAS | O/Z | Active-low EMIF SDRAM row strobe. EMIF.SDRAS is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01. | | |
| | HPI.HAS | I | Active-low HPI address strobe. This signal latches the address in the HPIA register in the HPI Multiplexed mode. HPI.HAS is selected when the Parallel Port Mode bit field is set to 11. | | |
| | GPIO12 | I/O/Z | General-purpose IO12. GPIO12 is selected when the Parallel Port Mode bit field is set to 10. | | |
| C11 | | I/O/Z | EMIF SDRAM column strobe or HPI chip select input. This pin serves in one of two functions: EMIF SDRAM column strobe (EMIF.SDCAS) or HPI chip select input (HPI.HCS). The initial state of this pin depends on the GPIO0 pin. See Section 3.6.1 for more information. | BK | GPIO0 = 1: Output, EMIF.SDCAS GPIO0 = 0: Input, HPI.HCS |
| | EMIF.SDCAS | O/Z | Active-low EMIF SDRAM column strobe. EMIF.SDCAS is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01. | | |
| | HPI.HCS | I | HPI Chip Select Input. HPI.HCS is the select input for the HPI and must be driven low during accesses. HPI.HCS is selected when the Parallel Port Mode bit field is set to 10 or 11. | | |
| C12 | | I/O/Z | EMIF SDRAM write enable or HPI Data Strobe 1 input. This pin serves in one of two functions: EMIF SDRAM write enable (EMIF.SDWE) or HPI data strobe 1 (HPI.HDS1). The initial state of this pin depends on the GPIO0 pin. See Section 3.6.1 for more information. | BK | GPIO0 = 1: Output, EMIF.SDWE GPIO0 = 0: Input, HPI.HDS1 |
| | EMIF.SDWE | O/Z | EMIF SDRAM write enable. EMIF.SDWE is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01. | | |
| | HPI.HDS1 | I | HPI Data Strobe 1 Input. HPI.HDS1 is driven by the host read or write strobes to control the transfer. HPI.HDS1 is selected when the Parallel Port Mode bit field is set to 10 or 11. | | |

Table 2-2. Signal Descriptions (continued)

| TERMINAL NAME | MULTIPLEXED SIGNAL NAME | I/O/Z ⁽¹⁾ | FUNCTION | BK ⁽²⁾ | RESET CONDITION |
|---------------------------------|------------------------------|----------------------|--|-------------------------------------|--|
| C13 | | I/O/Z | SDRAM A10 address line or general-purpose IO13. This pin serves in one of two functions: SDRAM A10 address line (EMIF.SDA10) or general-purpose IO13 (GPIO13). The initial state of this pin depends on the GPIO0 pin. See Section 3.6.1 for more information. | BK | GPIO0 = 1: Output, EMIF.SDA10 GPIO0 = 0: Input, GPIO13 |
| | EMIF.SDA10 | O/Z | SDRAM A10 address line. Address line/autoprecharge disable for SDRAM memory. Serves as a row address bit (logically equivalent to A12) during ACTV commands and also disables the autoprecharging function of SDRAM during read or write operations. EMIF.SDA10 is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01. | | |
| | GPIO13 | I/O/Z | General-purpose IO13. GPIO13 is selected when the Parallel Port Mode bit field is set to 10 or 11. | | |
| C14 | | I/O/Z | Memory interface clock for SDRAM, HPI Data Strobe 2 input, or general-purpose IO14. This pin serves in one of two functions: memory interface clock for SDRAM (EMIF.CLKMEM) or HPI data strobe 2 (HPI.HDS2). The initial state of this pin depends on the GPIO0 pin. See Section 3.6.1 for more information. | BK | GPIO0 = 1: Output, EMIF.CLKMEM GPIO0 = 0: Input, HPI.HDS2 |
| | EMIF.CLKMEM | O/Z | Memory interface clock for SDRAM. EMIF.CLKMEM is selected when the Parallel Port Mode bit field of the External Bus Selection Register is set to 00 or 01. | | |
| | HPI.HDS2 | I | HPI Data Strobe 2 Input. HPI.HDS2 is driven by the host read or write strobes to control the transfer. HPI.HDS2 is selected when the Parallel Port Mode bit field is set to 10 or 11. | | |
| INTERRUPT AND RESET PINS | | | | | |
| | $\overline{\text{INT}}[4:0]$ | I | Active-low external user interrupt inputs. $\overline{\text{INT}}[4:0]$ are maskable and are prioritized by the interrupt enable register (IER) and the interrupt mode bit. | H, FS | Input |
| | $\overline{\text{RESET}}$ | I | Active-low reset. $\overline{\text{RESET}}$ causes the digital signal processor (DSP) to terminate execution and forces the program counter to FF8000h. When $\overline{\text{RESET}}$ is brought to a high level, execution begins at location FF8000h of program memory. $\overline{\text{RESET}}$ affects various registers and status bits. Use an external pullup resistor on this pin. | H, FS | Input |
| BIT I/O SIGNALS | | | | | |
| GPIO[7:6, 4:0] | | I/O/Z | 7-bit Input/Output lines that can be individually configured as inputs or outputs, and also individually set or reset when configured as outputs. At reset, these pins are configured as inputs. After reset, the on-chip bootloader samples GPIO[3:0] to determine the boot mode selected. | BK (GPIO5 only) H (except GPIO5) | Input |
| | EMIF.CKE (GPIO4) | O/Z | SDRAM CKE signal. The GPIO4 pin can be configured to serve as SDRAM CKE pin by setting the following bits in the External Bus Selection Register: CKE SEL = 1 and CKE EN = 1. In default mode, this pin serves as GPIO4. | | Input (GPIO4) |

Table 2-2. Signal Descriptions (continued)

| TERMINAL NAME | MULTIPLEXED SIGNAL NAME | I/O/Z ⁽¹⁾ | FUNCTION | BK ⁽²⁾ | RESET CONDITION |
|---|-------------------------|----------------------|--|-------------------|-------------------|
| XF | | O/Z | External flag. XF is set high by the BSET XF instruction, set low by BCLR XF instruction or by loading ST1. XF is used for signaling other processors in multiprocessor configurations or used as a general-purpose output pin. XF goes into the high-impedance state when $\overline{\text{OFF}}$ is low, and is set high following reset. | | Output |
| | EMIF.CKE | O/Z | SDRAM CKE signal. The XF pin can be configured to serve as SDRAM CKE pin by setting the following bits in the External Bus Selection Register: CKE SEL = 0 and CKE EN = 1. In default mode, this pin serves as XF. | | Output (XF) |
| OSCILLATOR/CLOCK SIGNALS | | | | | |
| CLKOUT | | O/Z | DSP clock output signal. CLKOUT cycles at the machine-cycle rate of the CPU. $\overline{\text{CLKOUT}}$ goes into high-impedance state when $\overline{\text{OFF}}$ is low. | | Output |
| X2/CLKIN | | I/O | System clock/oscillator input. If the internal oscillator is not being used, X2/CLKIN functions as the clock input. NOTE: The USB module requires a 48-MHz clock. Since this input clock is used by both the CPU PLL and the USB module PLL, it must be a factor of 48 MHz in order for the programmable PLL to produce the required 48-MHz USB module clock. In CLKGEN domain idle (OSC IDLE) mode, this pin becomes output and is driven low to stop external crystals (if used) from oscillating or an external clock source from driving the DSP's internal logic. | | Oscillator Input |
| X1 | | O | Output pin from the internal system oscillator for the crystal. If the internal oscillator is not used, X1 should be left unconnected. X1 does not go into the high-impedance state when $\overline{\text{OFF}}$ is low. | | Oscillator Output |
| TIMER SIGNALS | | | | | |
| TIN/TOUT0 | | I/O/Z | Timer0 Input/Output. When output, TIN/TOUT0 signals a pulse or a change of state when the on-chip timer counts down past zero. When input, TIN/TOUT0 provides the clock source for the internal timer module. At reset, this pin is configured as an input. NOTE: Only the Timer0 signal is brought out. The Timer1 signal is terminated internally and is not available for external use. | H | Input |
| REAL-TIME CLOCK | | | | | |
| RTCINX1 | | I | Real-Time Clock Oscillator input | | Input |
| RCINX2 | | O | Real-Time Clock Oscillator output | | Output |
| I²C | | | | | |
| SDA | | I/O/Z | I ² C (bidirectional) data. At reset, this pin is in high-impedance mode. | H | Hi-Z |
| SCL | | I/O/Z | I ² C (bidirectional) clock. At reset, this pin is in high-impedance mode. | H | Hi-Z |
| MULTICHANNEL BUFFERED SERIAL PORTS SIGNALS | | | | | |
| CLKR0 | | I/O/Z | McBSP0 receive clock. CLKR0 serves as the serial shift clock for the serial port receiver. At reset, this pin is in high-impedance mode. | H | Hi-Z |

Table 2-2. Signal Descriptions (continued)

| TERMINAL NAME | MULTIPLEXED SIGNAL NAME | I/O/Z ⁽¹⁾ | FUNCTION | BK ⁽²⁾ | RESET CONDITION |
|---------------|-------------------------|----------------------|--|-------------------|-----------------|
| DR0 | | I | McBSP0 receive data | FS | Input |
| FSR0 | | I/O/Z | McBSP0 receive frame synchronization. The FSR0 pulse initiates the data receive process over DR0. At reset, this pin is in high-impedance mode. | | Hi-Z |
| CLKX0 | | I/O/Z | McBSP0 transmit clock. CLKX0 serves as the serial shift clock for the serial port transmitter. The CLKX0 pin is configured as input after reset. | H | Input |
| DX0 | | O/Z | McBSP0 transmit data. DX0 is placed in the high-impedance state when <u>not</u> transmitting, when RESET is asserted, or when OFF is low. | | Hi-Z |
| FSX0 | | I/O/Z | McBSP0 transmit frame synchronization. The FSX0 pulse initiates the data transmit process over DX0. Configured as an input following reset. | | Input |
| CLKR1 | | I/O/Z | McBSP1 receive clock. CLKR1 serves as the serial shift clock for the serial port receiver. | H | Input |
| DR1 | | I/Z | McBSP1 serial data receive | | Input |
| FSR1 | | I/Z | McBSP1 receive frame synchronization. The FSR1 pulse initiates the data receive process over DR1. | | Input |
| DX1 | | O/Z | McBSP1 serial data transmit. DX1 is placed in the high-impedance state when <u>not</u> transmitting, when RESET is asserted, or when OFF is low. | BK | Hi-Z |
| CLKX1 | | I/O/Z | McBSP1 transmit clock. CLKX1 serves as the serial shift clock for the serial port transmitter. The CLKX1 pin is configured as input after reset. | H | Input |
| CLKR2 | | I/O/Z | McBSP2 receive clock. CLKR2 serves as the serial shift clock for the serial port receiver. | H | Input |
| DR2 | | I | McBSP2 serial data receive | | Input |
| FSR2 | | I | McBSP2 receive frame synchronization. The FSR2 pulse initiates the data receive process over DR2. | | Input |
| DX2 | | O/Z | McBSP2 serial data transmit. DX2 is placed in the high-impedance state when <u>not</u> transmitting, when RESET is asserted, or when OFF is low. | BK | Hi-Z |
| CLKX2 | | I/O/Z | McBSP2 transmit clock. CLKX2 serves as the serial shift clock for the serial port transmitter. The CLKX2 pin is configured as input after reset. | H | Input |
| FSX2 | | I/O/Z | McBSP2 frame synchronization. The FSX2 pulse initiates the data transmit process over DX2. FSX2 is configured as an input following reset. | | Input |
| USB | | | | | |
| DP | | I/O/Z | Differential (positive) receive/transmit. At reset, this pin is configured as input. | | Input |
| DN | | I/O/Z | Differential (negative) receive/transmit. At reset, this pin is configured as input. | | Input |
| PU | | O/Z | Pullup output. This pin is used to pull up the detection resistor required by the USB specification. The pin is internally connected to USBVDD via a software controllable switch (CONN bit of the USBCTL register). | | Hi-Z |
| A/D | | | | | |
| AIN0 | | I | Analog Input Channel 0 | | Input |
| AIN1 | | I | Analog Input Channel 1 | | Input |

Table 2-2. Signal Descriptions (continued)

| TERMINAL NAME | MULTIPLEXED SIGNAL NAME | I/O/Z ⁽¹⁾ | FUNCTION | BK ⁽²⁾ | RESET CONDITION |
|-------------------------------|-------------------------|----------------------|--|-------------------|-----------------|
| TEST/EMULATION PINS | | | | | |
| TCK | | I | IEEE standard 1149.1 test clock. TCK is normally a free-running clock signal with a 50% duty cycle. The changes on test access port (TAP) of input signals TMS and TDI are clocked into the TAP controller, instruction register, or selected test data register on the rising edge of TCK. Changes at the TAP output signal (TDO) occur on the falling edge of TCK. | PU H | Input |
| TDI | | I | IEEE standard 1149.1 test data input. Pin with internal pullup device. TDI is clocked into the selected register (instruction or data) on a rising edge of TCK. | PU | Input |
| TDO | | O/Z | IEEE standard 1149.1 test data output. The contents of the selected register (instruction or data) are shifted out of TDO on the falling edge of TCK. TDO is in the high-impedance state except when the scanning of data is in progress. | | Hi-Z |
| TMS | | I | IEEE standard 1149.1 test mode select. Pin with internal pullup device. This serial control input is clocked into the TAP controller on the rising edge of TCK. | PU | Input |
| $\overline{\text{TRST}}$ | | I | IEEE standard 1149.1 test reset. $\overline{\text{TRST}}$, when high, gives the IEEE standard 1149.1 scan system control of the operations of the device. If $\overline{\text{TRST}}$ is not connected or driven low, the device operates in its functional mode, and the IEEE standard 1149.1 signals are ignored. This pin has an internal pulldown. | PD FS | Input |
| EMU0 | | I/O/Z | Emulator 0 pin. When $\overline{\text{TRST}}$ is driven low, EMU0 must be high for activation of the $\overline{\text{OFF}}$ condition. When $\overline{\text{TRST}}$ is driven high, EMU0 is used as an interrupt to or from the emulator system and is defined as I/O by way of the IEEE standard 1149.1 scan system. | PU | Input |
| EMU1/ $\overline{\text{OFF}}$ | | I/O/Z | Emulator 1 pin/disable all outputs. When $\overline{\text{TRST}}$ is driven high, EMU1/ $\overline{\text{OFF}}$ is used as an interrupt to or from the emulator system and is defined as I/O by way of IEEE standard 1149.1 scan system. When $\overline{\text{TRST}}$ is driven low, EMU1/ $\overline{\text{OFF}}$ is configured as $\overline{\text{OFF}}$. The EMU1/ $\overline{\text{OFF}}$ signal, when active-low, puts all output drivers into the high-impedance state. Note that $\overline{\text{OFF}}$ is used exclusively for testing and emulation purposes (not for multiprocessing applications). Therefore, for the $\overline{\text{OFF}}$ condition, the following apply: $\overline{\text{TRST}}$ = low, EMU0 = high, EMU1/ $\overline{\text{OFF}}$ = low. | PU | Input |
| SUPPLY PINS | | | | | |
| CV _{DD} | | S | Digital Power, + VDD. Dedicated power supply for the core CPU. | | |
| DV _{DD} | | S | Digital Power, + VDD. Dedicated power supply for the I/O pins. | | |
| USBV _{DD} | | S | Digital Power, + VDD. Dedicated power supply for the I/O of the USB module (DP, DN, and PU). | | |
| RDV _{DD} | | S | Digital Power, + VDD. Dedicated power supply for the I/O pins of the RTC module. | | |
| RCV _{DD} | | S | Digital Power, + VDD. Dedicated power supply for the RTC module. | | |
| AV _{DD} | | S | Analog Power, + VDD. Dedicated power supply for the 10-bit A/D. | | |

3 Functional Overview

3.1 Functional Block Diagram

The following functional overview is based on the block diagram in Figure 3-1.

* Number of pins determined by package type.

Figure 3-1. Block Diagram of the SM320VC5507

3.2 Memory

The 5507 supports a unified memory map (program and data accesses are made to the same physical space). The total on-chip memory is 192K bytes (64K 16-bit words of RAM and 32K 16-bit words of ROM).

3.2.1 On-Chip Dual-Access RAM (DARAM)

The DARAM is located in the byte address range 000000h–00FFFFh and is composed of eight blocks of 8K bytes each (see [Table 3-1](#)). Each DARAM block can perform two accesses per cycle (two reads, two writes, or a read and a write). DARAM can be accessed by the internal program, data, or DMA buses. The HPI can only access the first four (32K bytes) DARAM blocks.

Table 3-1. DARAM Blocks

| BYTE ADDRESS RANGE | MEMORY BLOCK |
|--------------------|---|
| 000000h – 001FFFh | DARAM 0 (HPI accessible) ⁽¹⁾ |
| 002000h – 003FFFh | DARAM 1 (HPI accessible) |
| 004000h – 005FFFh | DARAM 2 (HPI accessible) |
| 006000h – 007FFFh | DARAM 3 (HPI accessible) |
| 008000h – 009FFFh | DARAM 4 |
| 00A000h – 00BFFFh | DARAM 5 |
| 00C000h – 00DFFFh | DARAM 6 |
| 00E000h – 00FFFFh | DARAM 7 |

(1) First 192 bytes are reserved for Memory-Mapped Registers (MMRs).

3.2.2 On-Chip Single-Access RAM (SARAM)

The SARAM is located at the byte address range 010000h–01FFFFh and is composed of 8 blocks of 8K bytes each (see [Table 3-2](#)). Each SARAM block can perform one access per cycle (one read or one write). SARAM can be accessed by the internal program, data, or DMA buses.

Table 3-2. SARAM Blocks

| BYTE ADDRESS RANGE | MEMORY BLOCK |
|--------------------|--------------|
| 010000h – 011FFFh | SARAM 0 |
| 012000h – 013FFFh | SARAM 1 |
| 014000h – 015FFFh | SARAM 2 |
| 016000h – 017FFFh | SARAM 3 |
| 018000h – 019FFFh | SARAM 4 |
| 01A000h – 01BFFFh | SARAM 5 |
| 01C000h – 01DFFFh | SARAM 6 |
| 01E000h – 01FFFFh | SARAM 7 |

3.2.3 On-Chip Read-Only Memory (ROM)

The one-wait-state ROM is located at the byte address range FF0000h–FFFFFFh, for a total of 64K bytes of ROM. The ROM address space can be mapped by software to the external memory or to the internal ROM.

The standard 5507 device includes a bootloader program resident in the ROM. When the MPNMC bit field of the ST3 status register is set through software, the on-chip ROM is disabled and not present in the memory map, and byte address range FF0000h–FFFFFFh is directed to external memory space. A hardware reset always clears the MPNMC bit, so it is not possible to disable the ROM at reset. However, the software reset instruction does not affect the MPNMC bit. The on-chip ROM can be accessed by the program, data, or DMA buses. The first 16-bit word access to ROM requires three cycles. Subsequent accesses require two cycles per 16-bit word.

3.2.4 Memory Maps

3.2.4.1 PGE Package Memory Map

The PGE package features 14 address bits representing 32K-/16K-byte linear address for asynchronous memories per CE space. Due to address row/column multiplexing, address reach for SDRAM devices is 4M bytes for each CE space. The largest SDRAM device that can be used with the 5507 in a PGE package is 128M-bit SDRAM.

| Byte Address (Hex) [†] | Memory Blocks | Block Size |
|---------------------------------|---|--|
| 000000 | MMR (Reserved) | |
| 0000C0 | DARAM / HPI Access | (32K- 192) Bytes |
| 008000 | DARAM‡ | 32K Bytes |
| 010000 | SARAM§ | 64K Bytes |
| 020000 | Reserved | |
| 040000 | External $\overline{\text{CE}}_0$ | 32K/16K Bytes - Asynchronous* 4M Bytes - 128K Bytes SDRAM# |
| 400000 | External $\overline{\text{CE}}_1$ | 32K/16K Bytes - Asynchronous* 4M Bytes - SDRAM |
| 800000 | External $\overline{\text{CE}}_2$ | 32K/16K Bytes - Asynchronous* 4M Bytes - SDRAM |
| C00000 | External $\overline{\text{CE}}_3$ | 32K/16K Bytes - Asynchronous* 4M Bytes - SDRAM (MPNMC = 1) 4M Bytes - 64K Bytes if internal ROM selected (MPNMC = 0) |
| FF0000 | ROM (if MPNMC=0) External $\overline{\text{CE}}_3$ (if MPNMC=1) | 64K Bytes |
| FFFFFF | | |

† Address shown represents the first byte address in each block.

‡ Dual-access RAM (DARAM): two accesses per cycle per block, 8 blocks of 8K bytes.

§ Single-access RAM (SARAM): one access per cycle per block, 8 blocks of 8K bytes.

¶ External memory spaces are selected by the chip-enable signal shown ($\overline{\text{CE}}[0:3]$). Supported memory types include: asynchronous static RAM (SRAM) and synchronous DRAM (SDRAM).

The minus 128K bytes consists of 32K-byte DARAM/HPI access, 32K-byte DARAM, and 64K-byte SARAM.

|| Read-only memory (ROM): one access every two cycles.

* 32K bytes for 16-bit-wide memory. 16K bytes for 8-bit-wide memory.

Figure 3-2. SM320VC5507 Memory Map

3.2.5 Boot Configuration

The on-chip bootloader provides a method to transfer application code and tables from an external source to the on-chip RAM memory at power up. These options include:

- Enhanced host-port interface (HPI) in multiplexed or nonmultiplexed mode
- External asynchronous memory boot (via the EMIF) from 8-bit-wide or 16-bit-wide memory
- Serial port boot (from McBSP0) with 8-bit or 16-bit data length
- Serial EPROM boot (from McBSP0) supporting EPROMs with 16-bit or 24-bit address
- USB boot
- I²C EEPROM
- Direct execution from external 16-bit-wide asynchronous memory

External pins select the boot configuration. The values of GPIO[3:0] are sampled, following reset, upon execution of the on-chip bootloader code. It is not possible to disable the bootloader at reset because the 5507 always starts execution from the on-chip ROM following a hardware reset. A summary of boot configurations is shown in [Table 3-3](#). For more information on using the bootloader, see the Using the TMS320VC5503/VC5507/VC5509/VC5509A Bootloader application report (literature number [SPRA375](#)).

Table 3-3. Boot Configuration Summary

| GPIO0 | GPIO3 | GPIO2 | GPIO1 | BOOT MODE PROCESS |
|-------|-------|-------|-------|--|
| 0 | 0 | 0 | 0 | Reserved |
| 0 | 0 | 0 | 1 | Serial (SPI) EPROM Boot (24-bit address) via McBSP0 |
| 0 | 0 | 1 | 0 | USB |
| 0 | 0 | 1 | 1 | I ² C EEPROM (7-bit address) |
| 0 | 1 | 0 | 0 | Reserved |
| 0 | 1 | 0 | 1 | HPI – multiplexed mode |
| 0 | 1 | 1 | 0 | HPI – nonmultiplexed mode |
| 0 | 1 | 1 | 1 | Reserved |
| 1 | 0 | 0 | 0 | Execute from 16-bit-wide asynchronous memory (on $\overline{CE1}$ space) |
| 1 | 0 | 0 | 1 | Serial (SPI) EPROM Boot (16-bit address) via McBSP0 |
| 1 | 0 | 1 | 0 | 8-bit asynchronous memory (on $\overline{CE1}$ space) |
| 1 | 0 | 1 | 1 | 16-bit asynchronous memory (on $\overline{CE1}$ space) |
| 1 | 1 | 0 | 0 | Reserved |
| 1 | 1 | 0 | 1 | Reserved |
| 1 | 1 | 1 | 0 | Standard serial boot via McBSP0 (16-bit data) |
| 1 | 1 | 1 | 1 | Standard serial boot via McBSP0 (8-bit data) |

3.3 Peripherals

The 5507 supports the following peripherals:

- A configurable parallel external interface supporting either:
 - 16-bit external memory interface (EMIF) for asynchronous memory and/or SDRAM
 - 16-bit enhanced host-port interface (HPI)
- A six-channel direct memory access (DMA) controller
- A programmable phase-locked loop clock generator
- Two 20-bit timers
- Watchdog timer
- Three multichannel buffered serial ports (McBSPs)
- Eight configurable general-purpose I/O pins

- USB full-speed slave interface supporting:
 - Bulk
 - Interrupt
 - Isochronous
- I²C multi-master and slave interface (I²C compatible except, no fail-safe I/O buffers)
- Real-time clock with crystal input, separate clock domain and supply pins
- 4-channel 10-bit Successive Approximation A/D

For detailed information on the C55x DSP peripherals, see the following documents:

- TMS320C55x DSP Functional Overview (literature number [SPRU312](#))
- TMS320C55x DSP Peripherals Overview Reference Guide (literature number [SPRU317](#))

3.4 Direct Memory Access (DMA) Controller

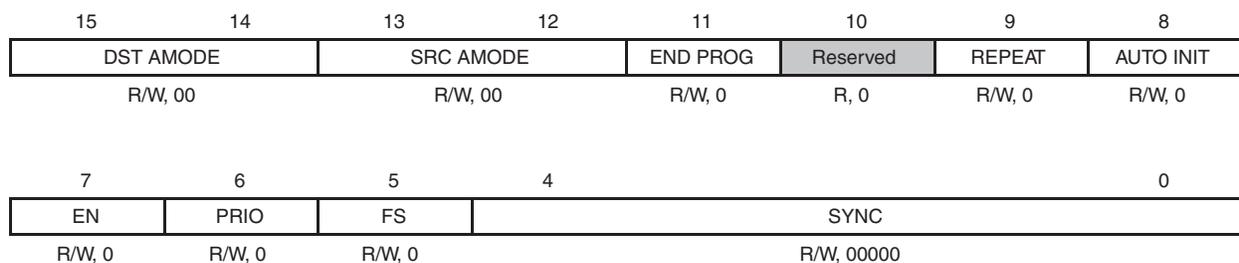

The 5507 DMA provides the following features:

- Four standard ports, one for each of the following data resources: DARAM, SARAM, peripherals and external memory
- Six channels, which allow the DMA controller to track the context of six independent DMA channels
- Programmable low/high priority for each DMA channel
- One interrupt for each DMA channel
- Event synchronization. DMA transfers in each channel can be dependent on the occurrence of selected events.
- Programmable address modification for source and destination addresses
- Dedicated idle domain allows the DMA controller to be placed in a low-power (idle) state under software control.
- Dedicated DMA channel used by the HPI to access internal memory (DARAM)

The 5507 DMA controller allows transfers to be synchronized to selected events. The 5507 supports 15 separate sync events and each channel can be tied to separate sync events independent of the other channels. Sync events are selected by programming the SYNC field in the channel-specific DMA channel control register (DMA_CCR).

3.4.1 DMA Channel Control Register (DMA_CCR)

The channel control register (DMA_CCR) bit layouts are shown in [Figure 3-3](#).

LEGEND: R = Read, W = Write, n = value after reset

Figure 3-3. DMA_CCR Bit Locations

The SYNC[4:0] bits specify the event that can initiate the DMA transfer for the corresponding DMA channel. The five bits allow several configurations as listed in [Table 3-4](#). The bits are set to zero upon reset. For those synchronization modes with more than one peripheral listed, the Serial Port Mode bit field of the External Bus Selection Register dictates which peripheral event is actually connected to the DMA input.

Table 3-4. Synchronization Control Function

| SYNC FIELD IN DMA_CCR | SYNCHRONIZATION MODE |
|-----------------------|--|
| 00000b | No event synchronized |
| 00001b | McBSP 0 receive event (REVT0) |
| 00010b | McBSP 0 transmit event (XEVT0) |
| 00011b | Reserved. These bits should always be written with 0. |

| Other values | Reserved (do not use these values) |

(1) The I²C receive event (REVTI2C) and external interrupt 4 (INT4) share a synchronization input to the DMA. When the SYNC field of the DMA_CCR is set to 10011b, the logical OR of these two sources is used for DMA synchronization.

3.5 I²C Interface

The SM320VC5507 includes an I²C serial port. The I²C port supports:

- Compatibility with Philips I²C Specification Revision 2.1 (January 2000)
- Operation at 100 Kbps or 400 Kbps
- 7-bit addressing mode
- Master (transmit/receive) and slave (transmit/receive) modes of operation
- Events: DMA, interrupt, or polling

The I²C module clock must be in the range from 7 MHz to 12 MHz. This is necessary for proper operation of the I²C module. With the I²C module clock in this range, the noise filters on the SDA and SCL pins suppress noise that has a duration of 50 ns or shorter. The I²C module clock is derived from the DSP clock divided by a programmable prescaler.

NOTE

I/O buffers are not fail-safe. The SDA and SCL pins could potentially draw current if the device is powered down and SDA and SCL are driven by other devices connected to the I²C bus.

3.6 Configurable External Buses

The 5507 offers combinations of configurations for its external parallel port. This allows the system designer to choose the appropriate media interface for its application without the need of a large-pin-count package. The External Bus Selection Register controls the routing of the parallel port signals.

3.6.1 External Bus Selection Register (EBSR)

The External Bus Selection Register determines the mapping of the 21 address signals, 16 data signals, and 15 control signals of the external parallel port. The External Bus Selection Register is memory-mapped at port address 0x6C00. Once the bit fields of this register are changed, the routing of the signals takes place on the next CPU clock cycle.

The reset value of the parallel port mode bit field is determined by the state of the GPIO0 pin at reset. If GPIO0 is high at reset, the full EMIF mode is enabled and the parallel port mode bit field is set to 01. If GPIO0 is low at reset, the HPI multiplexed mode is enabled and the parallel port mode bit field is set to 11. After reset, the parallel port should be selected to function in either EMIF mode or HPI mode. Dynamic switching of the parallel port, once configured, is not recommended.

NOTE: These bits are Reserved and must be kept as 0000 during any writes to EBSR.

Figure 3-4. External Bus Selection Register

Table 3-5. External Bus Selection Register Bit Field Description

| BITS | DESCRIPTION |
|------|---|
| 15 | CLKOUT disable CLKOUT disable = 0: CLKOUT enabled CLKOUT disable = 1: CLKOUT disabled |
| 14 | Oscillator disable. Works with IDLE instruction to put the clock generation domain into IDLE mode. OSC disable = 0: Oscillator enabled OSC disable = 1: Oscillator disabled |
| 13 | Host mode idle bit (applicable only if the parallel bus is configured as EHPI) When the parallel bus is set to EHPI mode, the clock domain is not allowed to go to idle, so a host processor can access the DSP internal memory. The HIDL bit works around this restriction and allows the DSP to idle the clock domain and the EHPI. When the clock domain is in idle, a host processor will not be able to access the DSP memory. HIDL = 0: Host access to DSP enabled. Idling EHPI and clock domain is not allowed. HIDL = 1: Idles the HPI and the clock domain upon execution of the IDLE instruction when the parallel port mode is set to 10 or 11 selecting HPI mode. In addition, bit 4 of the Idle Control Register must be set to 1 prior to the execution of the IDLE instruction. |
| 12 | Bus keeper enable ⁽¹⁾ $\overline{\text{BKE}}$ = 0: Bus keeper, pullups/pulldowns enabled $\overline{\text{BKE}}$ = 1: Bus keeper, pullups/pulldowns disabled |
| 11 | SDRAM self-refresh status bit SR STAT = 0: SDRAM self-refresh signal is not asserted. SR STAT = 1: SDRAM self-refresh signal is asserted. |

(1) Function available when the port or pins configured as input.

Table 3-5. External Bus Selection Register Bit Field Description (continued)

| BITS | DESCRIPTION |
|------|--|
| 10 | EMIF hold HOLD = 0: DSP drives the external memory bus HOLD = 1: Request the external memory bus to be placed in high-impedance so that another device can drive the memory bus |
| 9 | EMIF hold acknowledge HOLDA = 0: DSP indicates that a hold request on the external memory bus has occurred, the EMIF completed any pending external bus activity, and placed the external memory bus signals in high-impedance state (address bus, data bus, $\overline{CE}[3:0]$, AOE, AWE, ARE, SDRAS, SDCAS, \overline{SDWE} , SDA10, CLKMEM). Once this bit is cleared, an external device can drive the bus. HOLDA = 1: No hold acknowledge |
| 8 | SDRAM CKE pin selection bit CKE SEL = 0: Use XF for SDRAM CKE signal CKE SEL = 1: Use GPIO.4 for SDRAM CKE signal |
| 7 | SDRAM CKE enable bit CKE EN = 0: XF or GPIO.4 operates in normal mode CKE EN = 1: Based on the CKE SEL bit, either XF or GPIO.4 drives the SDRAM CKE pin |
| 6 | SDRAM self-refresh command SR CMD = 0: EMIF will not issue a SDRAM self-refresh command SR CMD = 1: EMIF will issue a SDRAM self-refresh command |
| 5-2 | Reserved. Must be kept as 0000 during any writes to EBSR. |
| 1-0 | Parallel port mode. EMIF/HPI/GPIO Mode. Determines the mode of the parallel port. Parallel Port Mode = 00: Data EMIF mode. The 16 EMIF data signals and 13 EMIF control signals are routed to the corresponding external parallel bus data and control signals. The 16 address bus signals can be used as general-purpose I/O only. Parallel Port Mode = 01: Full EMIF mode. The 21 address signals, 16 data signals, and 15 control signals are routed to the corresponding external parallel bus address, data, and control signals. Parallel Port Mode = 10: Non-multiplexed HPI mode. The HPI is enabled and its 14 address signals, 16 data signals, and 7 control signals are routed to the corresponding address, data, control signals of the external parallel bus. Moreover, 8 control signals of the external parallel bus are used as general-purpose I/O. Parallel Port Mode = 11: Multiplexed HPI mode. The HPI is enabled and its 16 data signals and 10 control signals are routed to the external parallel bus. In addition, 3 control signals of the external parallel bus are used as general-purpose I/O. The 16 external parallel port address bus signals are used as general-purpose I/O. |

3.6.2 Parallel Port

The parallel port of the 5507 consists of 21 address signals, 16 data signals, and 15 control signals. Its 14 bits for address allow it to access 2M bytes of external memory when using the asynchronous SRAM interface. On the other hand, the SDRAM interface can access the whole external memory space of 16M bytes. The parallel bus supports four different modes:

- **Full EMIF mode:** the EMIF with its 21 address signals, 16 data signals, and 15 control signals routed to the corresponding external parallel bus address, data, and control signals.
- **Data EMIF mode:** the EMIF with its 16 data signals, and 15 control signals routed to the corresponding external parallel bus data and control signals. The 16 address bus signals can be used as general-purpose I/O signals only.
- **Non-multiplexed HPI mode:** the HPI is enabled with its 14 address signals, 16 data signals, and 8 control signals routed to the corresponding address, data, and control signals of the external parallel bus. Moreover, 7 control signals of the external parallel bus are used as general-purpose I/O.
- **Multiplexed HPI mode:** the HPI is enabled with its 16 data signals and 10 control signals routed to the external parallel bus. In addition, 5 control signals of the external parallel bus are used as general-purpose I/O. The external parallel port's 16 address signals are used as general-purpose I/O.

(2) A[20:16] of the BGA package always functions as EMIF address pins and they cannot be reconfigured for any other function.

3.6.3 Parallel Port Signal Routing

The 5507 allows access to 16-bit-wide (read and write) or 8-bit-wide (read only) asynchronous memory and 16-bit-wide SDRAM. For 16-bit-wide memories, EMIF.A[0] is kept low and is not used. To provide as many address pins as possible, the 5507 routes the parallel port signals as shown in [Figure 3-5](#).

[Figure 3-5](#) shows the addition of the A'[0] signal in the BGA package. This pin is used for asynchronous memory interface only, while the A[0] pin is used with HPI or GPIO. [Figure 3-6](#) summarizes the use of the parallel port signals for memory interfacing.

3.7 General-Purpose Input/Output (GPIO) Ports

3.7.1 Dedicated General-Purpose I/O

The 5507 provides eight dedicated general-purpose input/output pins, GPIO0–GPIO7. Each pin can be independently configured as an input or an output using the I/O Direction Register (IODIR). The I/O Data Register (IODATA) is used to monitor the logic state of pins configured as inputs and control the logic state of pins configured as outputs. See Table 3-29 for address information. The description of the IODIR is shown in Figure 3-7 and Table 3-7. The description of IODATA is shown in Figure 3-8 and Table 3-8.

To configure a GPIO pin as an input, clear the direction bit that corresponds to the pin in IODIR to 0. To read the logic state of the input pin, read the corresponding bit in IODATA.

To configure a GPIO pin as an output, set the direction bit that corresponds to the pin in IODIR to 1. To control the logic state of the output pin, write to the corresponding bit in IODATA.

| 7–0 | IOxD | pin ⁽¹⁾ | IOx Data Bit. IOxD = 0; The signal on the IOx pin is low. IOxD = 1; The signal on the IOx pin is high. If IOx is configured as an output (IOxDIR = 1 in IODIR): IOxD = 0; Drive the signal on the IOx pin low. IOxD = 1; Drive the signal on the IOx pin high. |

(1) pin = value present on the pin (IO7–IO0 default to inputs after reset)

3.7.2 Address Bus General-Purpose I/O

The 16 address signals, EMIF.A[15–0], can also be individually enabled as GPIO when the Parallel Port Mode bit field of the External Bus Selection Register is set for Data EMIF (00) or Multiplexed EHPI mode (11). These pins are controlled by three registers: the enable register, AGPIOEN, determines if the pins serve as GPIO or address (see Figure 3-9); the direction register, AGPIODIR, determines if the GPIO enabled pin is an input or output (see Figure 3-10); and the data register, AGPIODATA, determines the logic states of the pins in general-purpose I/O mode (see Figure 3-11).

If AIODIRn = 0, then: AIODx = 0; Corresponding I/O pin is read as a low. AIODx = 1; Corresponding I/O pin is read as a high. If AIODIRn = 1, then: AIODx = 0; Set corresponding I/O pin to low. AIODx = 1; Set corresponding I/O pin to high. |

3.7.3 EHPI General-Purpose I/O

Six control lines of the External Parallel Bus can also be set as general-purpose I/O when the Parallel Port Mode bit field of the External Bus Selection Register is set to Nonmultiplexed EHPI (10) or Multiplexed EHPI mode (11). These pins are controlled by three registers: the enable register, EHPIGPIOEN, determines if the pins serve as GPIO or address (see Figure 3-12); the direction register, EHPIGPIODIR, determines if the GPIO enabled pin is an input or output (see Figure 3-13); and the data register, EHPIGPIODATA, determines the logic states of the pins in GPIO mode (see Figure 3-14).

CLKDIV 000 = CLKOUT represents the CPU clock divided by 1 CLKDIV 001 = CLKOUT represents the CPU clock divided by 2 CLKDIV 010 = CLKOUT represents the CPU clock divided by 4 CLKDIV 011 = CLKOUT represents the CPU clock divided by 6 CLKDIV 100 = CLKOUT represents the CPU clock divided by 8 CLKDIV 101 = CLKOUT represents the CPU clock divided by 10 CLKDIV 110 = CLKOUT represents the CPU clock divided by 12 CLKDIV 111 = CLKOUT represents the CPU clock divided by 14 |

3.9 USB Clock Generation

The USB module can be clocked from either an Analog Phase-Locked Loop (APLL) or a Digital Phase-Locked Loop (DPLL). The APLL is the recommended USB clock source due to better noise tolerance and less long-term jitter than the DPLL. To maintain the backward compatibility, the DPLL is the power-up default clock source for the USB module.

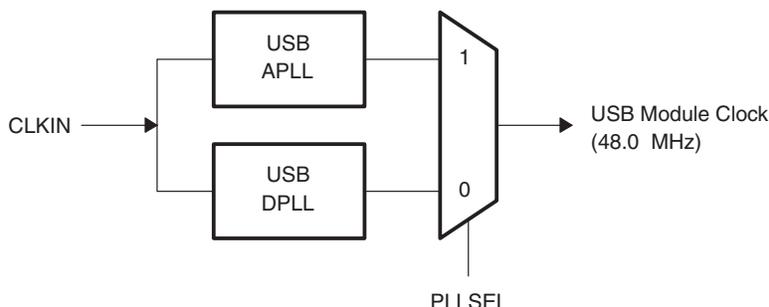

Figure 3-16. USB Clock Generation

| 1 | X | ON | | | | | | | | | | | | | |
| X | 1 | ON | | | | | | | | | | | | | |
| 1 | MODE | 0 | PLL mode selection bit MODE = 0; PLL operating in divide mode (VCO bypassed). When the PLL is operating in DIV mode, the PLL Divide Factor (D) is determined by the factor K. D = 2 if K = 1 to 15 D = 4 if K = 16 MODE = 1; PLL operating in multiply mode (VCO on). The PLL multiply and divide factors are determined by DIV and K. | | | | | | | | | | | | |
| 0 | STAT | 0 | PLL lock status bit STAT = 0; PLL operating in DIV mode (VCO bypassed) STAT = 1; PLL operating in multiply mode (VCO on) | | | | | | | | | | | | |

DIV, combined with MODE and K, defines the final PLL multiplication ratio M/D as indicated below. The USB APLL clock frequency can be simply expressed by [Equation 1](#).

$$F_{\text{USB APLL CLK}} = F_{\text{CLKIN}} \times (M/D)$$

The multiplication factor M and the dividing factor D are defined in [Table 3-18](#).

Table 3-18. M and D Values Based on MODE, DIV, and K

| MODE | DIV | K | M | D |
|------|-----|---------|-----|---|
| 0 | X | 1 to 15 | 1 | 2 |
| 0 | X | 16 | 1 | 4 |
| 1 | 0 | 1 to 15 | K | 1 |
| 1 | 0 | 16 | 1 | 1 |
| 1 | 1 | Odd | K | 2 |
| 1 | 1 | Even | K-1 | 4 |

The USB clock generation and the PLL switching scheme are discussed in detail in the TMS320VC5507/5509 DSP Universal Serial Bus (USB) Module Reference Guide (literature number [SPRU596](#)) and in the Using the USB APLL on the TMS320VC5507/5509A Application Report (literature number [SPRA997](#)).

3.10 Memory-Mapped Registers

The 5507 has 78 memory-mapped CPU registers that are mapped in data memory space address 0h to 4Fh. [Table 3-19](#) provides a list of the CPU memory-mapped registers (MMRs) available.

Table 3-19. CPU Memory-Mapped Registers

| REGISTER | WORD ADDRESS (HEX) | DESCRIPTION | BIT FIELD |
|----------|--------------------|------------------------------------|-----------|
| IER0 | 00 | Interrupt enable register 0 | [15-0] |
| IFR0 | 01 | Interrupt flag register 0 | [15-0] |
| ST0_55 | 02 | Status register 0 for C55x | [15-0] |
| ST1_55 | 03 | Status register 1 for C55x | [15-0] |
| ST3_55 | 04 | Status register 3 for C55x | [15-0] |
| – | 05 | Reserved | [15-0] |
| ST0 | 06 | Status register ST0 | [15-0] |
| ST1 | 07 | Status register ST1 | [15-0] |

| ST2_55 | 4B | Status register 2 for C55x | [15–0] |
| SSP | 4C | System stack pointer | [15–0] |
| SP | 4D | User stack pointer | [15–0] |
| SPH | 4E | Extended data page pointer for the SP and the SSP | [6–0] |
| CDPH | 4F | Main data page pointer for the CDP | [6–0] |

3.11 Peripheral Register Description

Each 5507 device has a set of memory-mapped registers associated with peripherals as listed in [Table 3-20](#) through [Table 3-35](#). Some registers use less than 16 bits. When reading these registers, unused bits are always read as 0.

NOTE

The CPU access latency to the peripheral memory-mapped registers is 6 CPU cycles. Following peripheral register update(s), the CPU must wait at least 6 CPU cycles before attempting to use that peripheral. When more than one peripheral register is updated in a sequence, the CPU only needs to wait following the final register write. For example, if the EMIF is being reconfigured, the CPU must wait until the very last EMIF register update takes effect before trying to access the external memory. The users should consult the respective peripheral user's guide to determine if a peripheral requires additional time to initialize itself to the new configuration after the register updates take effect.

Before reading or writing to the USB register, the USB module has to be brought out of reset by setting bit 2 of the USB Idle Control and Status Register.

Table 3-20. Idle Control, Status, and System Registers

| WORD ADDRESS | REGISTER NAME | DESCRIPTION | RESET VALUE ⁽¹⁾ |
|--------------|---------------|-----------------------|----------------------------|
| 0x0001 | ICR[7:0] | Idle control register | xxxx xxxx 0000 0100 |
| 0x0002 | ISTR[7:0] | Idle status register | xxxx xxxx 0000 0000 |
| 0x07FD | SYSR[15:0] | System register | 0000 0000 0000 0000 |

(1) Hardware reset; x denotes a "don't care".

Table 3-21. External Memory Interface Registers

| WORD ADDRESS | REGISTER NAME | DESCRIPTION | RESET VALUE ⁽¹⁾ |
|--------------|------------------------------|----------------------------|---|
| 0x1C00 | CLKMD[14:0] | Clock mode register | 0010 0000 0000 0010 DIV1 mode |
| 0x1E00 | USBDPLL[14:0] ⁽²⁾ | USB DPLL control register | If non-USB boot mode: 0010 0000 0000 0110 DIV2 mode |
| | | | If USB boot mode: 0010 0010 0001 0011 PLL MULT4 mode |
| 0x1E80 | USBPLLSEL[2:0] | USB PLL selection register | 0000 0000 0000 0100 |
| 0x1F00 | USBAPLL[15:0] | USB APLL control register | 0000 0000 0000 0000 |

(1) Hardware reset; x denotes a “don’t care.”

(2) DPLL is the power-up default USB clock source.

Table 3-25. Timers

| WORD ADDRESS | REGISTER NAME | DESCRIPTION | RESET VALUE ⁽¹⁾ |
|--------------|---------------|------------------------------------|----------------------------|
| 0x1000 | TIM0[15:0] | Timer count register, timer #0 | 1111 1111 1111 1111 |
| 0x1001 | PRD0[15:0] | Period register, timer #0 | 1111 1111 1111 1111 |
| 0x1002 | TCR0[15:0] | Timer control register, timer #0 | 0000 0000 0001 0000 |
| 0x1003 | PRSC0[15:0] | Timer prescaler register, timer #0 | xxxx 0000 xxxx 0000 |
| 0x2400 | TIM1[15:0] | Timer count register, timer #1 | 1111 1111 1111 1111 |
| 0x2401 | PRD1[15:0] | Period register, timer #1 | 1111 1111 1111 1111 |
| 0x2402 | TCR1[15:0] | Timer control register, timer #1 | 0000 0000 0001 0000 |
| 0x2403 | PRSC1[15:0] | Timer prescaler register, timer #1 | xxxx 0000 xxxx 0000 |

(1) Hardware reset; x denotes a “don’t care.”

Table 3-26. Multichannel Serial Port #0

| PORT ADDRESS (WORD) | REGISTER NAME | DESCRIPTION | RESET VALUE ⁽¹⁾ |
|---------------------|---------------|--|----------------------------|
| 0x2800 | DRR2_0[15:0] | Data receive register 2, McBSP #0 | 0000 0000 0000 0000 |

Table 3-34. Analog-to-Digital Controller (ADC) Registers

| WORD ADDRESS | REGISTER NAME | DESCRIPTION | RESET VALUE ⁽¹⁾ |
|--------------|-----------------|-------------------------------------|----------------------------|
| 0x6800 | ADCCTL[15:11] | ADC control register | 0111 0000 0000 0000 |
| 0x6801 | ADCDATA[15:0] | ADC data register | 0111 0000 0000 0000 |
| 0x6802 | ADCCLKDIV[15:0] | ADC function clock divider register | 0000 0000 0000 1111 |
| 0x6803 | ADCCLKCTL[8:0] | ADC clock control register | 0000 0000 0000 0111 |

(1) Hardware reset; x denotes a “don’t care.”

Table 3-35. External Bus Selection Register

| WORD ADDRESS | REGISTER NAME | DESCRIPTION | RESET VALUE ⁽¹⁾ |
|--------------|---------------|---------------------------------|------------------------------------|
| 0x6C00 | EBSR[15:0] | External bus selection register | 0000 0000 0000 0011 ⁽²⁾ |

(1) Hardware reset; x denotes a “don’t care.”

(2) The reset value is 0000 0000 0000 0001 if GPIO0 = 1; the value is 0000 0000 0000 0011 if GPIO0 = 0.

3.12 Interrupts

Vector-relative locations and priorities for all internal and external interrupts are shown in [Table 3-36](#).

Table 3-36. Interrupt Table

| NAME | SOFTWARE (TRAP) EQUIVALENT | RELATIVE LOCATION ⁽¹⁾ (HEX BYTES) | PRIORITY | FUNCTION |
|--------------------|----------------------------|--|----------|---|
| RESET | SINT0 | 0 | 0 | Reset (hardware and software) |
| NMI ⁽²⁾ | SINT1 | 8 | 1 | Nonmaskable interrupt |
| BERR | SINT24 | C0 | 2 | Bus error interrupt |
| INT0 | SINT2 | 10 | 3 | External interrupt #0 |
| INT1 | SINT16 | 80 | 4 | External interrupt #1 |
| INT2 | SINT3 | 18 | 5 | External interrupt #2 |
| TINT0 | SINT4 | 20 | 6 | Timer #0 interrupt |
| RINT0 | SINT5 | 28 | 7 | McBSP #0 receive interrupt |
| XINT0 | SINT17 | 88 | 8 | McBSP #0 transmit interrupt |
| RINT1 | SINT6 | 30 | 9 | McBSP #1 receive interrupt |
| XINT1 | SINT7 | 38 | 10 | McBSP #1 transmit interrupt |
| USB | SINT8 | 40 | 11 | USB interrupt |
| DMAC0 | SINT18 | 90 | 12 | DMA channel #0 interrupt |
| DMAC1 | SINT9 | 48 | 13 | DMA channel #1 interrupt |
| DSPINT | SINT10 | 50 | 14 | Interrupt from host |
| INT3/WDTINT | SINT11 | 58 | 15 | External interrupt #3 or watchdog timer interrupt |

(1) Absolute addresses of the interrupt vector locations are determined by the contents of the IVPD and IVPH registers. Interrupt vectors for interrupts 0–15 and 24–31 are relative to IVPD. Interrupt vectors for interrupts 16–23 are relative to IVPH.

(2) The NMI pin is internally tied high. However, NMI interrupt vector can be used for SINT1 and Watchdog Timer Interrupt.

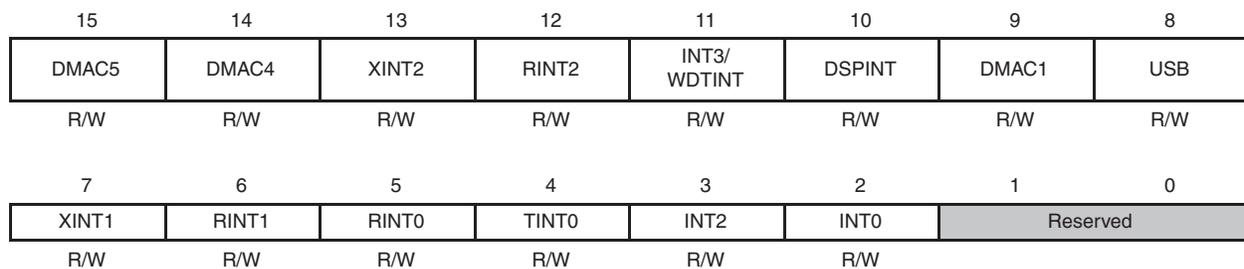

Table 3-36. Interrupt Table (continued)

| | | | | |
|-------------------------|--------|----|----|--|
| INT4/RTC ⁽³⁾ | SINT19 | 98 | 16 | External interrupt #4 or RTC interrupt |
| RINT2 | SINT12 | 60 | 17 | McBSP #2 receive interrupt |
| XINT2 | SINT13 | 68 | 18 | McBSP #2 transmit interrupt |
| DMAC2 | SINT20 | A0 | 19 | DMA Channel #2 interrupt |
| DMAC3 | SINT21 | A8 | 20 | DMA Channel #3 interrupt |
| DMAC4 | SINT14 | 70 | 21 | DMA Channel #4 interrupt |
| DMAC5 | SINT15 | 78 | 22 | DMA Channel #5 interrupt |
| TINT1 | SINT22 | B0 | 23 | Timer #1 interrupt |
| IIC | SINT23 | B8 | 24 | I ² C interrupt |
| DLOG | SINT25 | C8 | 25 | Data log interrupt |
| RTOS | SINT26 | D0 | 26 | Real-time operating system interrupt |
| - | SINT27 | D8 | 27 | Software interrupt #27 |
| - | SINT28 | E0 | 28 | Software interrupt #28 |
| - | SINT29 | E8 | 29 | Software interrupt #29 |
| - | SINT30 | F0 | 30 | Software interrupt #30 |
| - | SINT31 | F8 | 31 | Software interrupt #31 |

(3) It is recommended that either the INT4 or RTC interrupt be used. If both INT4 and RTC interrupts are used, one interrupt event can potentially hold off the other interrupt. For example, if INT4 is asserted first and held low, the RTC interrupt will not be recognized until the INT4 pin is back to high-logic state again. The INT4 pin must be pulled high if only the RTC interrupt is used.

3.12.1 IFR and IER Registers

The IFR0 (Interrupt Flag Register 0) and IER0 (Interrupt Enable Register 0) bit layouts are shown in Figure 3-19.

LEGEND: R = Read, W = Write, n = value after reset

Figure 3-19. IFR0 and IER0 Bit Locations

Table 3-37. IFR0 and IER0 Register Bit Fields

| BIT | | FUNCTION |
|--------|-------------|---|
| NUMBER | NAME | |
| 15 | DMAC5 | DMA channel 5 interrupt flag/mask bit |
| 14 | DMAC4 | DMA channel 4 interrupt flag/mask bit |
| 13 | XINT2 | This bit is used as the McBSP2 transmit interrupt flag/mask bit. |
| 12 | RINT2 | McBSP2 receive interrupt flag/mask bit. |
| 11 | INT3/WDTINT | This bit is used as either the external user interrupt 3 flag/mask bit, or the watchdog timer interrupt flag/mask bit. ⁽¹⁾ |
| 10 | DSPINT | HPI host-to-DSP interrupt flag/mask. |
| 9 | DMAC1 | DMA channel 1 interrupt flag/mask bit |
| 8 | USB | USB interrupt flag/mask bit. |

(1) It is possible to have active interrupts simultaneously from both the external INT3 source and the watchdog timer. When an interrupt is detected in this bit, the watchdog timer status register should be polled to determine if the watchdog timer is the interrupt source.

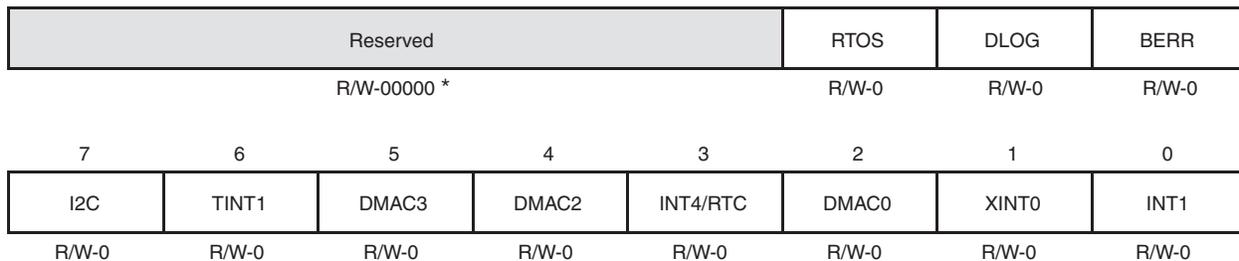

Table 3-37. IFR0 and IER0 Register Bit Fields (continued)

| | | |
|-----|-------|--|
| 7 | XINT1 | This bit is used as the McBSP1 transmit interrupt flag/mask bit. |
| 6 | RINT1 | McBSP1 receive interrupt flag/mask bit. |
| 5 | RINT0 | McBSP0 receive interrupt flag bit |
| 4 | TINT0 | Timer 0 interrupt flag bit |
| 3 | INT2 | External interrupt 2 flag bit |
| 2 | INT0 | External interrupt 0 flag bit |
| 1-0 | - | Reserved for future expansion. These bits should always be written with 0. |

The IFR1 (Interrupt Flag Register 1) and IER1 (Interrupt Enable Register 1) bit layouts are shown in [Figure 3-20](#).

NOTE

It is possible to have active interrupts simultaneously from both the external interrupt 4 (INT4) and the real-time clock (RTC). When an interrupt is detected in this bit, the real-time clock status register should be polled to determine if the real-time clock is the source of the interrupt.

LEGEND: R = Read, W = Write, n = value after reset
 * Always write zeros.

Figure 3-20. IFR1 and IER1 Bit Locations

Table 3-38. IFR1 and IER1 Register Bit Fields

| BIT | | FUNCTION |
|--------|----------|---|
| NUMBER | NAME | |
| 15-11 | - | Reserved for future expansion. These bits should always be written with 0. |
| 10 | RTOS | Real-time operating system interrupt flag/mask bit |
| 9 | DLOG | Data log interrupt flag/mask bit |
| 8 | BERR | Bus error interrupt flag/mask bit |
| 7 | I2C | I ² C interrupt flag/mask bit |
| 6 | TINT1 | Timer 1 interrupt flag/mask bit |
| 5 | DMAC3 | DMA channel 3 interrupt flag/mask bit |
| 4 | DMAC2 | DMA channel 2 interrupt flag/mask bit |
| 3 | INT4/RTC | This bit can be used as either the external user interrupt 4 flag/mask bit, or the real-time clock interrupt flag/mask bit. |
| 2 | DMAC0 | DMA channel 0 interrupt flag/mask bit |
| 1 | XINT0 | McBSP transmit 0 interrupt flag/mask bit |
| 0 | INT1 | External user interrupt 1 flag/mask bit |

3.12.2 Interrupt Timing

The external interrupts ($\overline{\text{INT}}[4:0]$) are synchronized to the CPU by way of a two-flip-flop synchronizer. The interrupt inputs are sampled on falling edges of the CPU clock. A sequence of 1-1-0-0 on consecutive cycles on the interrupt pin is required for an interrupt to be detected. Therefore, the minimum low pulse duration on the external interrupts on the 5507 is three CPU clock periods.

3.12.3 Waking Up From IDLE Condition

One of the following four events can wake up the CPU from IDLE:

- Hardware Reset
- External Interrupt
- RTC Interrupt
- USB Event (Reset or Resume)

3.12.3.1 Waking Up From IDLE With Oscillator Disabled

With an external interrupt, a RTC interrupt, or an USB resume/reset, the clock generation circuit wakes up the oscillator and enables the USB PLL to determine the oscillator stable time. In the case of the interrupt being disabled by clearing the associated bit in the Interrupt Enable Register (IERx), the CPU is not “woken up”. If the interrupt due to the wake-up event is enabled, the interrupt is sent to the CPU only after the oscillator is stabilized and the USB PLL is locked. If the external interrupt serves as the wake-up event, the interrupt line must stay low for a minimum of 3 CPU cycles after the oscillator is stabilized to wake up the CPU. Otherwise, only the clock domain will wake up and another external interrupt will be needed to wake up the CPU.

Once out of IDLE, any system not using the USB should put the USB module in idle mode to reduce power consumption.

For more details on the SM320VC5507 oscillator-disable process, see the Disabling the Internal Oscillator on the TMS320VC5507/5509/5509A DSP application report (literature number [SPRA078](#)).

3.12.4 Idling Clock Domain When External Parallel Bus Operating in EHPI Mode

The clock domain cannot be idled when the External Parallel Bus is operating in EHPI mode to ensure host access to the DSP memory. To work around this restriction, use the HIDL bit of the External Bus Selection Register (EBSR) with the CLKGENI bit of the Idle Control Register (ICR) to idle the clock domain.

4 Support

4.1 Notices Concerning JTAG (IEEE 1149.1) Boundary Scan Test Capability

4.1.1 Initialization Requirements for Boundary Scan Test

The SM320VC5507 uses the JTAG port for boundary scan tests, emulation capability and factory test purposes. To use boundary scan test, the EMU0 and EMU1/OFF pins must be held LOW through a rising edge of the TRST signal prior to the first scan. This operation selects the appropriate TAP control for boundary scan. If at any time during a boundary scan test a rising edge of TRST occurs when EMU0 or EMU1/OFF are not low, a factory test mode may be selected preventing boundary scan test from being completed. For this reason, it is recommended that EMU0 and EMU1/OFF be pulled or driven low at all times during boundary scan test.

4.1.2 Boundary Scan Description Language (BSDL) Model

BSDL models are available on the web in the TMS320VC5507 product folder under the “simulation models” section.

4.2 Documentation Support

Extensive documentation supports all TMS320™ DSP family of devices from product announcement through applications development. The following types of documentation are available to support the design and use of the TMS320C5000™ platform of DSPs:

- TMS320C55x™ DSP Functional Overview (literature number [SPRU312](#))
- Device-specific data sheets and data manuals
- Complete user's guides
- Development support tools
- Hardware and software application reports

TMS320C55x reference documentation includes, but is not limited to, the following:

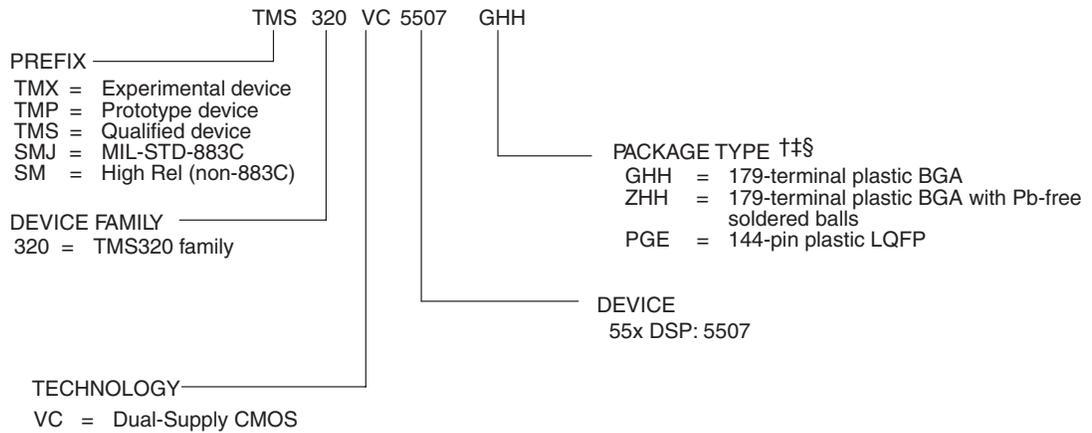

- TMS320C55x DSP CPU Reference Guide (literature number [SPRU371](#))
- TMS320C55x DSP Mnemonic Instruction Set Reference Guide (literature number [SPRU374](#))
- TMS320C55x DSP Algebraic Instruction Set Reference Guide (literature number [SPRU375](#))
- TMS320C55x DSP Programmer's Guide (literature number [SPRU376](#))
- TMS320C55x DSP Peripherals Overview Reference Guide (literature number [SPRU317](#))
- TMS320C55x Optimizing C/C++ Compiler User's Guide (literature number [SPRU281](#))
- TMS320C55x Assembly Language Tools User's Guide (literature number [SPRU280](#))
- TMS320C55x DSP Library Programmer's Reference (literature number [SPRU422](#))
- TMS320VC5507/5509 DSP Universal Serial Bus (USB) Module Reference Guide (literature number [SPRU596](#))
- Using the USB APLL on the TMS320VC5507/5509A Application Report (literature number [SPRA997](#))
- Using the TMS320VC5503/VC5507/VC5509/VC5509A Bootloader Application Report (literature number [SPRA375](#))
- Disabling the Internal Oscillator on the TMS320VC5507/5509/5509A DSP application report (literature number [SPRA078](#))
- Using the TMS320C5509/C5509A USB Bootloader Application Report (literature number [SPRA840](#))

The reference guides describe in detail the TMS320C55x™ DSP products currently available and the hardware and software applications, including algorithms, for fixed-point TMS320™ DSP family of devices.

A series of DSP textbooks is published by Prentice-Hall and John Wiley & Sons to support digital signal processing research and education. The TMS320™ DSP newsletter, Details on Signal Processing, is published quarterly and distributed to update TMS320™ DSP customers on product information.

Information regarding TI DSP products is also available on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL).

4.3 TMS320VC5507 Device Nomenclature

† BGA = Ball Grid Array

LQFP = Low-Profile Quad Flatpack

‡ The ZHH mechanical package designator represents the version of the GHH with PbFree soldered balls. The ZHH package devices are supported in the same speed grades as the GHH package devices (available upon request).

§ For actual device part numbers (P/Ns) and ordering information, see the Mechanical Data section of this document or the TI website (www.ti.com).

Figure 4-1. Device Nomenclature for the TMS320VC5507

5 Electrical Specifications

This section provides the absolute maximum ratings and the recommended operating conditions for the SM320VC5507 DSP.

All electrical and switching characteristics in this data manual are valid over the recommended operating conditions unless otherwise specified.

The list of absolute maximum ratings are specified over operating case temperature. Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under [Section 5.2](#) is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability. All voltage values are with respect to V_{SS} . [Figure 5-1](#) provides the test load circuit values for a 3.3-V I/O.

5.1 ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)

| | | VALUE | UNIT |
|-----------|----------------------------------|-------------|------|
| DV_{DD} | Supply voltage I/O range | –0.3 to 4.0 | V |
| CV_{DD} | Supply voltage core range | –0.3 to 2.0 | V |
| V_I | Input voltage range | –0.3 to 4.5 | V |
| V_O | Output voltage range | –0.3 to 4.5 | V |
| T_C | Operating case temperature range | –55 to 85 | °C |
| T_{stg} | Storage temperature range | –55 to 150 | °C |

5.2 RECOMMENDED OPERATING CONDITIONS

5.2.1 Recommended Operating Conditions for $CV_{DD} = 1.2\text{ V}$ (108 MHz)

over operating free-air temperature range (unless otherwise noted)

| | | MIN | NOM | MAX | UNIT |
|--------------------|---|---|----------------------|-----------------------------|------|
| CORE | | | | | |
| CV_{DD} | Device supply voltage | 1.14 | 1.2 | 1.26 | V |
| PERIPHERALS | | | | | |
| RCV_{DD} | RTC module supply voltage, core | 1.14 | 1.2 | 1.26 | V |
| RDV_{DD} | RTC module supply voltage, I/O (RTCINX1 and RTCINX2) | 1.14 | 1.2 | 1.26 | V |
| $USBPLL_{V_{DD}}$ | USBPLL supply voltage ⁽¹⁾ | 1.14 | 1.2 | 1.26 | V |
| $USB_{V_{DD}}$ | USB module supply voltage, I/O (DP, DN, and PU) | 3 | 3.3 | 3.6 | V |
| DV_{DD} | Device supply voltage, I/O (except DP, DN, PU, SDA, SCL) ⁽²⁾ | 2.7 | 3.3 | 3.6 | V |
| ADV_{DD} | A/D module digital supply voltage | 2.7 | 3.3 | 3.6 | V |
| AV_{DD} | A/D module analog supply voltage | 2.7 | 3.3 | 3.6 | V |
| GROUND | | | | | |
| V_{SS} | Supply voltage, GND, I/O, and core | | 0 | | V |
| ADV_{SS} | Supply voltage, GND, A/D module, digital | | 0 | | V |
| AV_{SS} | Supply voltage, GND, A/D module, analog | | 0 | | V |
| $USBPLL_{V_{SS}}$ | Supply voltage, GND, USBPLL | | 0 | | V |
| V_{IH} | High-level input voltage, I/O | DN and DP ⁽³⁾ | 2 | | V |
| | | SDA & SCL: V_{DD} related input levels ⁽²⁾ | $0.7 \times DV_{DD}$ | $DV_{DD}(\text{max}) + 0.5$ | |
| | | All other inputs (including hysteresis inputs) | 2 | $DV_{DD} + 0.3$ | |
| V_{IL} | Low-level input voltage, I/O | DN and DP ⁽³⁾ | | 0.8 | V |
| | | SDA & SCL: V_{DD} related input levels ⁽²⁾ | -0.5 | $0.3 \times DV_{DD}$ | |
| | | All other inputs (including hysteresis inputs) | -0.3 | 0.8 | |
| V_{hys} | Hysteresis level | Inputs with hysteresis only | | $0.1 \times DV_{DD}$ | V |
| I_{OH} | High-level output current | DN and DP ⁽³⁾ ($V_{OH} = 2.45\text{ V}$) | | -17 | mA |
| | | All other outputs | | -4 | |
| I_{OL} | Low-level output current | DN and DP ⁽³⁾ ($V_{OL} = 0.36\text{ V}$) | 17 | | mA |
| | | SDA and SCL ⁽²⁾ | | 3 | |
| | | All other outputs | | 4 | |
| T_C | Operating case temperature | | -55 | 85 | °C |

- (1) USB PLL is susceptible to power supply ripple. The maximum allowable supply ripple is 1% for 1 Hz to 5 kHz; 1.5% for 5 kHz to 10 MHz; 3% for 10 MHz to 100 MHz, and less than 5% for 100 MHz or greater.
- (2) The I²C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down. Due to the fact that different voltage devices can be connected to the I²C bus, the level of logic 0 (low) and logic 1 (high) are not fixed and depends on the associated V_{DD} .
- (3) USB I/O pins DP and DN can tolerate a short circuit at D+ and D- to 0 V or 5 V, as long as the recommended series resistors (see [Figure 5-40](#)) are connected between the D+ and DP (package), and the D- and DN (package). Do not apply a short circuit to the USB I/O pins DP and DN in absence of the series resistors.

5.2.2 Recommended Operating Conditions for $CV_{DD} = 1.35\text{ V}$ (144 MHz)

over operating free-air temperature range (unless otherwise noted)

| | | MIN | NOM | MAX | UNIT |
|--------------------|---|---|----------------------|-----------------------------|------|
| CORE | | | | | |
| CV_{DD} | Device supply voltage | 1.28 | 1.35 | 1.42 | V |
| PERIPHERALS | | | | | |
| RCV_{DD} | RTC module supply voltage, core | 1.28 | 1.35 | 1.42 | V |
| RDV_{DD} | RTC module supply voltage, I/O (RTCINX1 and RTCINX2) | 1.28 | 1.35 | 1.42 | V |
| $USBPLL_{V_{DD}}$ | USBPLL supply voltage ⁽¹⁾ | 1.28 | 1.35 | 1.42 | V |
| $USB_{V_{DD}}$ | USB module supply voltage, I/O (DP, DN, and PU) | 3 | 3.3 | 3.6 | V |
| DV_{DD} | Device supply voltage, I/O (except DP, DN, PU, SDA, SCL) ⁽²⁾ | 2.7 | 3.3 | 3.6 | V |
| ADV_{DD} | A/D module digital supply voltage | 2.7 | 3.3 | 3.6 | V |
| AV_{DD} | A/D module analog supply voltage | 2.7 | 3.3 | 3.6 | V |
| GROUND | | | | | |
| V_{SS} | Supply voltage, GND, I/O, and core | | 0 | | V |
| ADV_{SS} | Supply voltage, GND, A/D module, digital | | 0 | | V |
| AV_{SS} | Supply voltage, GND, A/D module, analog | | 0 | | V |
| $USBPLL_{V_{SS}}$ | Supply voltage, GND, USBPLL | | 0 | | V |
| V_{IH} | High-level input voltage, I/O | DN and DP ⁽³⁾ | 2 | | V |
| | | SDA & SCL: V_{DD} related input levels ⁽²⁾ | $0.7 \times DV_{DD}$ | $DV_{DD}(\text{max}) + 0.5$ | |
| | | All other inputs (including hysteresis inputs) | 2 | $DV_{DD} + 0.3$ | |
| V_{IL} | Low-level input voltage, I/O | DN and DP ⁽³⁾ | | 0.8 | V |
| | | SDA & SCL: V_{DD} related input levels ⁽²⁾ | -0.5 | $0.3 \times DV_{DD}$ | |
| | | All other inputs (including hysteresis inputs) | -0.3 | 0.8 | |
| V_{hys} | Hysteresis level | Inputs with hysteresis only | | $0.1 \times DV_{DD}$ | V |
| I_{OH} | High-level output current | DN and DP ⁽³⁾ ($V_{OH} = 2.45\text{ V}$) | | -17 | mA |

| | | All other outputs | | 4 | |
| T_C | Operating case temperature | -55 | | 85 | °C |

- (1) USB PLL is susceptible to power supply ripple. The maximum allowable supply ripple is 1% for 1 Hz to 5 kHz; 1.5% for 5 kHz to 10 MHz; 3% for 10 MHz to 100 MHz, and less than 5% for 100 MHz or greater.
- (2) The I²C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down. Due to the fact that different voltage devices can be connected to the I²C bus, the level of logic 0 (low) and logic 1 (high) are not fixed and depends on the associated V_{DD} .
- (3) USB I/O pins DP and DN can tolerate a short circuit at D+ and D- to 0 V or 5 V, as long as the recommended series resistors (see [Figure 5-40](#)) are connected between the D+ and DP (package), and the D- and DN (package). Do not apply a short circuit to the USB I/O pins DP and DN in absence of the series resistors.

5.2.3 Recommended Operating Conditions for $CV_{DD} = 1.6\text{ V}$ (200 MHz)

over operating free-air temperature range (unless otherwise noted)

| | | MIN | NOM | MAX | UNIT |
|--------------------|---|---|----------------------|-----------------------------|------|
| CORE | | | | | |
| CV_{DD} | Device supply voltage | 1.55 | 1.6 | 1.65 | V |
| PERIPHERALS | | | | | |
| RCV_{DD} | RTC module supply voltage, core | 1.55 | 1.6 | 1.65 | V |
| RDV_{DD} | RTC module supply voltage, I/O (RTCINX1 and RTCINX2) | 1.55 | 1.6 | 1.65 | V |
| $USBPLL_{V_{DD}}$ | USBPLL supply voltage ⁽¹⁾ | 1.55 | 1.6 | 1.65 | V |
| $USB_{V_{DD}}$ | USB module supply voltage, I/O (DP, DN, and PU) | 3 | 3.3 | 3.6 | V |
| DV_{DD} | Device supply voltage, I/O (except DP, DN, PU, SDA, SCL) ⁽²⁾ | 2.7 | 3.3 | 3.6 | V |

| V_{IH} | High-level input voltage, I/O | DN and DP ⁽³⁾ | 2 | | V |
| | | SDA & SCL: V_{DD} related input levels ⁽²⁾ | $0.7 \times DV_{DD}$ | $DV_{DD}(\text{max}) + 0.5$ | |
| | | All other inputs (including hysteresis inputs) | 2 | $DV_{DD} + 0.3$ | |
| V_{IL} | Low-level input voltage, I/O | DN and DP ⁽³⁾ | | 0.8 | V |
| | | SDA & SCL: V_{DD} related input levels ⁽²⁾ | -0.5 | $0.3 \times DV_{DD}$ | |
| | | All other inputs (including hysteresis inputs) | -0.3 | 0.8 | |
| V_{hys} | Hysteresis level | Inputs with hysteresis only | | $0.1 \times DV_{DD}$ | V |
| I_{OH} | High-level output current | DN and DP ⁽³⁾ ($V_{OH} = 2.45\text{ V}$) | | -17 | mA |
| | | All other outputs | | -4 | |
| I_{OL} | Low-level output current | DN and DP ⁽³⁾ ($V_{OL} = 0.36\text{ V}$) | 17 | | mA |
| | | SDA and SCL ⁽²⁾ | | 3 | |
| | | All other outputs | | 4 | |
| T_C | Operating case temperature | -55 | | 85 | °C |

- (1) USB PLL is susceptible to power supply ripple. The maximum allowable supply ripple is 1% for 1 Hz to 5 kHz; 1.5% for 5 kHz to 10 MHz; 3% for 10 MHz to 100 MHz, and less than 5% for 100 MHz or greater.
- (2) The I²C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down. Due to the fact that different voltage devices can be connected to the I²C bus, the level of logic 0 (low) and logic 1 (high) are not fixed and depends on the associated V_{DD} .
- (3) USB I/O pins DP and DN can tolerate a short circuit at D+ and D- to 0 V or 5 V, as long as the recommended series resistors (see [Figure 5-40](#)) are connected between the D+ and DP (package), and the D- and DN (package). Do not apply a short circuit to the USB I/O pins DP and DN in absence of the series resistors.

5.3 ELECTRICAL CHARACTERISTICS

5.3.1 Electrical Characteristics Over Recommended Operating Case Temperature Range for $CV_{DD} = 1.2\text{ V}$ (108 MHz) (Unless Otherwise Noted)

over operating free-air temperature range (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|-----------|---|--|---|-----------------------------|-----|--------------------|
| V_{OH} | High-level output voltage | DN and DP ⁽¹⁾ | USBV _{DD} = 3.0 V-3.6 V, I _{OH} = -300 μ A | 2.8 | | USBV _{DD} |
| | | PU | USBV _{DD} = 3.0 V-3.6 V, I _{OH} = -300 μ A | 0.9 x USBV _{DD} | | USBV _{DD} |
| | | All other outputs | DV _{DD} = 2.7 V-3.6 V, I _{OH} = MAX | 0.75 x DV _{DD} | | |
| V_{OL} | Low-level output voltage | SDA & SCL ⁽²⁾ | At 3 mA sink current | 0 | | 0.4 |
| | | DN and DP ⁽¹⁾ | I _{OL} = 3.0 mA | | | 0.3 |
| | | All other outputs | I _{OL} = MAX | | | 0.4 |
| I_{IZ} | Input current for outputs in high-impedance | Output-only or I/O pins with bus keepers (enabled) | DV _{DD} = MAX, V _O = V _{SS} to DV _{DD} | -300 | | 300 |
| | | All other output-only or I/O pins | DV _{DD} = MAX, V _O = V _{SS} to DV _{DD} | -5 | | 5 |
| I_I | Input current | Input pins with internal pulldown (enabled) | DV _{DD} = MAX, V _I = V _{SS} to DV _{DD} | 30 | | 300 |
| | | Input pins with internal pullup (enabled) | DV _{DD} = MAX, V _I = V _{SS} to DV _{DD} | -300 | | -30 |
| | | X2/CLKIN | DV _{DD} = MAX, V _I = V _{SS} to DV _{DD} | -50 | | 50 |
| | | All other input-only pins | DV _{DD} = MAX, V _I = V _{SS} to DV _{DD} | -5 | | 5 |
| I_{DCC} | CV_{DD} supply current, CPU + internal memory access ⁽³⁾ | | $CV_{DD} = 1.2\text{ V}$, CPU clock = 108 MHz, T _C = 25°C | 0.45 | | mA/MHz |
| I_{DDP} | DV _{DD} supply current, pins active ⁽⁴⁾ | | DV _{DD} = 3.3 V, CPU clock = 108 MHz, T _C = 25°C | 5.5 | | mA |
| I_{DCC} | CV_{DD} supply current, standby ⁽⁵⁾ | Oscillator disabled. All domains in low-power state | $CV_{DD} = 1.2\text{ V}$, T _C = 25°C (Nominal process) | 100 | | μ A |
| I_{DDP} | DV _{DD} supply current, standby | Oscillator disabled. All domains in low-power state. | DV _{DD} = 3.3 V, No I/O activity, T _C = 25°C | 10 | | μ A |
| C_i | Input capacitance | | | 3 | | pF |
| C_o | Output capacitance | | | 3 | | pF |

- (1) USB I/O pins DP and DN can tolerate a short circuit at D+ and D- to 0 V or 5 V, as long as the recommended series resistors (see [Figure 5-40](#)) are connected between the D+ and DP (package), and the D- and DN (package). Do not apply a short circuit to the USB I/O pins DP and DN in absence of the series resistors.
- (2) The I²C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
- (3) CPU executing 75% Dual MAC + 25% ADD with moderate data bus activity (table of sine values). CPU and CLKGEN (DPLL) domain are active. All other domains are idled.
- (4) One word of a table of a 16-bit sine value is written to the EMIF every 250 ns (64 Mbps). Each EMIF output pin is connected to a 10-pF load.
- (5) In CLKGEN domain idle mode, X2/CLKIN becomes output and is driven low to stop external crystals (if used) from oscillating. Standby current will be higher if an external clock source tries to drive the X2/CLKIN pin during this time.

5.3.2 Electrical Characteristics Over Recommended Operating Case Temperature Range for $CV_{DD} = 1.35\text{ V}$ (144 MHz) (Unless Otherwise Noted)

over operating free-air temperature range (unless otherwise noted)

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|-----------|--|--|---|-----------------------------|-----|--------------------|
| V_{OH} | High-level output voltage | DN and DP ⁽¹⁾ | USBV _{DD} = 3.0 V-3.6 V, I _{OH} = -300 μ A | 2.8 | | USBV _{DD} |
| | | PU | USBV _{DD} = 3.0 V-3.6 V, I _{OH} = -300 μ A | 0.9 x USBV _{DD} | | USBV _{DD} |
| | | All other outputs | DV _{DD} = 2.7 V-3.6 V, I _{OH} = MAX | 0.75 x DV _{DD} | | |
| V_{OL} | Low-level output voltage | SDA & SCL ⁽²⁾ | At 3 mA sink current | 0 | | 0.4 |
| | | DN and DP ⁽¹⁾ | I _{OL} = 3.0 mA | | | 0.3 |
| | | All other outputs | I _{OL} = MAX | | | 0.4 |
| I_{IZ} | Input current for outputs in high-impedance | Output-only or I/O pins with bus keepers (enabled) | DV _{DD} = MAX, V _O = V _{SS} to DV _{DD} | -300 | | 300 |
| | | All other output-only or I/O pins | DV _{DD} = MAX, V _O = V _{SS} to DV _{DD} | -5 | | 5 |

- (1) USB I/O pins DP and DN can tolerate a short circuit at D+ and D- to 0 V or 5 V, as long as the recommended series resistors (see [Figure 5-40](#)) are connected between the D+ and DP (package), and the D- and DN (package). Do not apply a short circuit to the USB I/O pins DP and DN in absence of the series resistors.
- (2) The I²C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
- (3) CPU executing 75% Dual MAC + 25% ADD with moderate data bus activity (table of sine values). CPU and CLKGEN (DPLL) domain are active. All other domains are idled.
- (4) One word of a table of a 16-bit sine value is written to the EMIF every 250 ns (64 Mbps). Each EMIF output pin is connected to a 10-pF load.
- (5) In CLKGEN domain idle mode, X2/CLKIN becomes output and is driven low to stop external crystals (if used) from oscillating. Standby current will be higher if an external clock source tries to drive the X2/CLKIN pin during this time.

NOTE: The data manual provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns or longer can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns or longer) from the data manual timings.

Input requirements in this data manual are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

Figure 5-1. 3.3-V Test Load Circuit

5.4 ESD Performance

ESD stress levels were performed in compliance with the following JEDEC standards with the results indicated below:

- Charged Device Model (CDM), based on JEDEC Specification JESD22-C101, passed at ± 500 V
- Human Body Model (HBM), based on JEDEC Specification JESD22-A114, passed at ± 1500 V

NOTE

According to industry research publications, ESD-CDM testing results show better correlation to manufacturing line and field failure rates than ESD-HBM testing. 500-V CDM is commonly considered as a safe passing level.

5.5 Timing Parameter Symbology

Timing parameter symbols used in the timing requirements and switching characteristics tables are created in accordance with JEDEC Standard 100. To shorten the symbols, some of the pin names and other related terminology have been abbreviated as follows:

| Lowercase Subscripts and Their Meanings | | Letters and Symbols and Their Meanings | |
|---|---------------------------------------|--|----------------|
| a | access time | H | High |
| c | cycle time (period) | L | Low |
| d | delay time | V | Valid |
| dis | disable time | Z | High-impedance |
| en | enable time | | |
| f | fall time | | |
| h | hold time | | |
| r | rise time | | |
| su | setup time | | |
| t | transition time | | |
| v | valid time | | |
| w | pulse duration (width) | | |
| x | unknown, changing or don't care level | | |

5.6 Clock Options

The frequency of the reference clock provided at the X2/CLKIN pin can be divided by a factor of two or four or multiplied by one of several values to generate the internal machine cycle.

5.6.1 Internal System Oscillator With External Crystal

The internal oscillator is always enabled following a device reset. The oscillator requires an external crystal connected across the X1 and X2/CLKIN pins. If the internal oscillator is not used, an external clock source must be applied to the X2/CLKIN pin and the X1 pin should be left unconnected. Since the internal oscillator can be used as a clock source to the PLLs, the crystal oscillation frequency can be multiplied to generate the CPU clock and USB clock, if desired.

The crystal should be in fundamental-mode operation, and parallel resonant, with a maximum effective series resistance (ESR) specified in [Table 5-1](#). The connection of the required circuit is shown in [Figure 5-2](#). Under some conditions, all the components shown are not required. The capacitors, C₁ and C₂, should be chosen such that [Equation 2](#) below is satisfied. C_L in [Equation 2](#) is the load specified for the crystal that is also specified in [Table 5-1](#).

$$C_L = \frac{C_1 C_2}{(C_1 + C_2)} \quad (2)$$

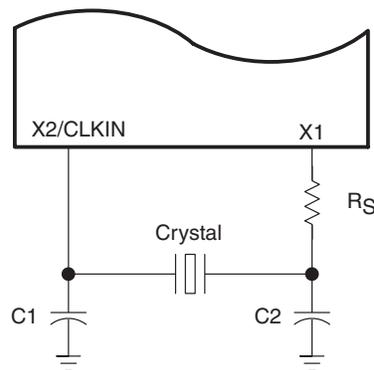

Figure 5-2. Internal System Oscillator With External Crystal

Table 5-1. Recommended Crystal Parameters

| FREQUENCY RANGE (MHz) | MAX ESR (Ω) | TYP C _{LOAD} (pF) | MAX C _{SHUNT} (pF) | R _S (Ω) |
|-----------------------|-------------|----------------------------|-----------------------------|--------------------|
| 20-15 | 20 | 10 | 7 | 0 |
| 15-12 | 30 | 16 | 7 | 0 |
| 12-10 | 40 | 16 | 7 | 100 |
| 10-8 | 60 | 18 | 7 | 470 |
| 8-6 | 80 | 18 | 7 | 1.5k |
| 6-5 | 80 | 18 | 7 | 2.2k |

Although the recommended ESR presented in [Table 5-1](#) is maximum, theoretically a crystal with a lower maximum ESR might seem to meet the requirement. It is recommended that crystals which meet the maximum ESR specification in [Table 5-1](#) are used.

5.6.2 Layout Considerations

Since parasitic capacitance, inductance and resistance can be significant in any circuit, good PC board layout

practices should always be observed when planning trace routing to the discrete components used in the oscillator circuit. Specifically, the crystal and the associated discrete components should be located as close to the DSP as physically possible. Also, X1 and X2/CLKIN traces should be separated as soon as possible after routing away from the DSP to minimize parasitic capacitance between them, and a ground trace should be run between these two signal lines. This also helps to minimize stray capacitance between these two signals.

5.6.3 Clock Generation in Bypass Mode (DPLL Disabled)

The frequency of the reference clock provided at the X2/CLKIN pin can be divided by a factor of one, two, or four to generate the internal CPU clock cycle. The divide factor (D) is set in the BYPASS_DIV field of the clock mode register. The contents of this field only affect clock generation while the device is in bypass mode. In this mode, the digital phase-locked loop (DPLL) clock synthesis is disabled.

Table 5-2 and Table 5-3 assume testing over recommended operating conditions and $H = 0.5t_{c(CO)}$ (see Figure 5-3).

Table 5-2. CLKIN Timing Requirements

| NO. | | | CV _{DD} = 1.2 V CV _{DD} = 1.35 V | | CV _{DD} = 1.6 V | | UNIT |
|-----|---------------------|----------------------------|---|--------------------|--------------------------|--------------------|------|
| | | | MIN | MAX | MIN | MAX | |
| C1 | t _{c(CI)} | Cycle time, X2/CLKIN | 20 | 400 ⁽¹⁾ | 20 | 400 ⁽¹⁾ | ns |
| C2 | t _{f(CI)} | Fall time, X2/CLKIN | | 4 | | 4 | ns |
| C3 | t _{r(CI)} | Rise time, X2/CLKIN | | 4 | | 4 | ns |
| C10 | t _{w(CIL)} | Pulse duration, CLKIN low | 6 | | 6 | | ns |
| C11 | t _{w(CIH)} | Pulse duration, CLKIN high | 6 | | 6 | | ns |

(1) This device utilizes a fully static design and therefore can operate with t_{c(CI)} approaching ∞. If an external crystal is used, the X2/CLKIN cycle time is limited by the crystal frequency range listed in Table 5-1.

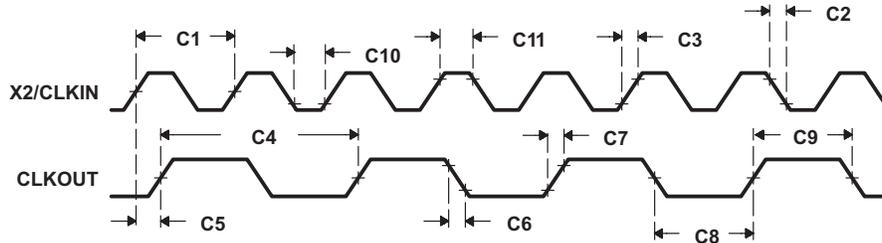

Table 5-3. CLKOUT Switching Characteristics

| NO. | | | CV _{DD} = 1.2 V CV _{DD} = 1.35 V | | | CV _{DD} = 1.6 V | | | UNIT |
|-----|-----------------------|--|---|---------------------------------------|---------------------|--------------------------|---------------------------------------|---------------------|------|
| | | | MIN | TYP | MAX | MIN | TYP | MAX | |
| C4 | t _{c(CO)} | Cycle time, CLKOUT | 20 ⁽¹⁾ | D x t _{c(CI)} ⁽²⁾ | 1600 ⁽³⁾ | 20 ⁽¹⁾ | D x t _{c(CI)} ⁽²⁾ | 1600 ⁽³⁾ | ns |
| C5 | t _{d(CI-CO)} | Delay time, X2/CLKIN high to CLKOUT high/low | 5 | 15 | 25 | 5 | 15 | 25 | ns |
| C6 | t _{f(CO)} | Fall time, CLKOUT | | 1 | | | 1 | | ns |
| C7 | t _{r(CO)} | Rise time, CLKOUT | | 1 | | | 1 | | ns |
| C8 | t _{w(COL)} | Pulse duration, CLKOUT low | H - 1 | | H + 1 | H - 1 | | H + 1 | ns |
| C9 | t _{w(COH)} | Pulse duration, CLKOUT high | H - 1 | | H + 1 | H - 1 | | H + 1 | ns |

(1) It is recommended that the DPLL synthesized clocking option be used to obtain maximum operating frequency.

(2) $D = 1/(\text{PLL Bypass Divider})$

(3) This device utilizes a fully static design and therefore can operate with t_{c(CO)} approaching ∞. If an external crystal is used, the X2/CLKIN cycle time is limited by the crystal frequency range listed in Table 5-1.

NOTE A: The relationship of X2/CLKIN to CLKOUT depends on the PLL bypass divide factor chosen for the CLKMD register. The waveform relationship shown in Figure 53 is intended to illustrate the timing parameters based on CLKOUT = 1/2(CLKIN) configuration.

Figure 5-3. Bypass Mode Clock Timings

5.6.4 Clock Generation in Lock Mode (DPLL Synthesis Enabled)

The frequency of the reference clock provided at the X2/CLKIN pin can be multiplied by a synthesis factor of N to generate the internal CPU clock cycle. The synthesis factor is determined by:

$$N = \frac{M}{D_L} \tag{3}$$

Where:

1. M = the multiply factor set in the PLL_MULT field of the clock mode register
2. D_L = the divide factor set in the PLL_DIV field of the clock mode register

Valid values for M are (multiply by) 2 to 31. Valid values for DL are (divide by) 1, 2, 3, and 4.

For detailed information on clock generation configuration, see the TMS320C55x DSP Peripherals Overview Reference Guide (literature number [SPRU317](#)).

Table 5-4 and Table 5-5 assume testing over recommended operating conditions and H = 0.5t_{c(CO)} (see Figure 5-4).

Table 5-4. CLKIN Timing Requirements

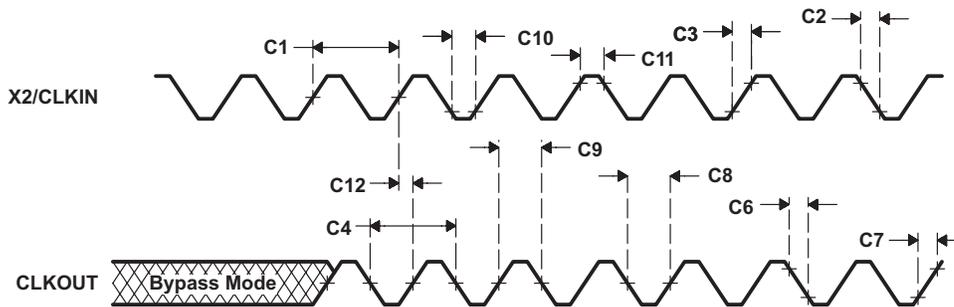

| NO. | | | CV _{DD} = 1.2 V CV _{DD} = 1.35 V | | CV _{DD} = 1.6 V | | UNIT | | |
|-----|---------------------|----------------------------|---|-----|--------------------------|-----|-------------------|-----|----|
| | | | MIN | MAX | MIN | MAX | | | |
| C1 | t _{c(CI)} | Cycle time, X2/CLKIN | DPLL synthesis enabled | | 20 ⁽¹⁾ | 400 | 20 ⁽¹⁾ | 400 | ns |
| C2 | t _{f(CI)} | Fall time, X2/CLKIN | | | 4 | | 4 | | ns |
| C3 | t _{r(CI)} | Rise time, X2/CLKIN | | | 4 | | 4 | | ns |
| C10 | t _{w(CIL)} | Pulse duration, CLKIN low | 6 | | 6 | | | | ns |
| C11 | t _{w(CIH)} | Pulse duration, CLKIN high | 6 | | 6 | | | | ns |

(1) This device utilizes a fully static design and therefore can operate with t_{c(CI)} approaching ∞. If an external crystal is used, the X2/CLKIN cycle time is limited by the crystal frequency range listed in Table 5-1 .

Table 5-5. Multiply-By-N Clock Option Switching Characteristics

(1) N = Clock frequency synthesis factor

NOTE A: The relationship of X2/CLKIN to CLKOUT depends on the PLL multiply and divide factor chosen for the CLKMD register. The waveform relationship shown in Figure 53 is intended to illustrate the timing parameters based on CLKOUT = 1xCLKIN configuration.

Figure 5-4. External Multiply-by-N Clock Timings

5.6.5 Real-Time Clock Oscillator With External Crystal

The real-time clock module includes an oscillator circuit. The oscillator requires an external 32.768-kHz crystal connected across the RTCINX1 and RTCINX2 pins. The connection of the required circuit, consisting of the crystal and two load capacitors, is shown in Figure 5-5. The load capacitors, C₁ and C₂, should be chosen such that Equation 4 below is satisfied. C_L in Equation 4 is the load specified for the crystal.

$$C_L = \frac{C_1 C_2}{(C_1 + C_2)} \tag{4}$$

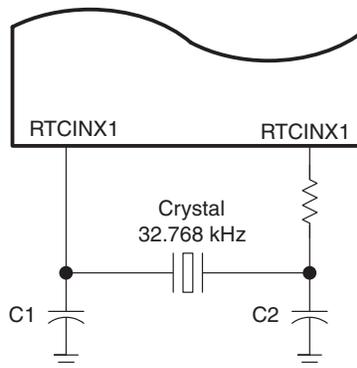

Figure 5-5. Real-Time Clock Oscillator With External Crystal

NOTE

The RTC can be idled by not supplying its 32-kHz oscillator signal. In order to keep RTC power dissipation to a minimum when the RTC module is not used, it is recommended that the RTC module be powered up, the RTC input pin (RTCINX1) be pulled low, and the RTC output pin (RTCINX2) be left floating.

Table 5-6. Recommended RTC Crystal Parameters

| PARAMETER | | MIN | NOM | MAX | UNIT |
|-----------|---|-----|--------|-----|------------|
| f_o | Frequency of oscillation ⁽¹⁾ | | 32.768 | | kHz |
| ESR | Series resistance ⁽¹⁾ | 30 | | 60 | k Ω |
| C_L | Load capacitance | | 12.5 | | pF |
| DL | Crystal drive level | | | 1 | μ W |

(1) ESR must be 200 k Ω or greater at frequencies other than 32.768 kHz. Otherwise, oscillations at overtone frequencies may occur.

5.7 Memory Interface Timings**5.7.1 Asynchronous Memory Timings**

Table 5-7 and Table 5-8 assume testing over recommended operating conditions (see Figure 5-6 and Figure 5-7).

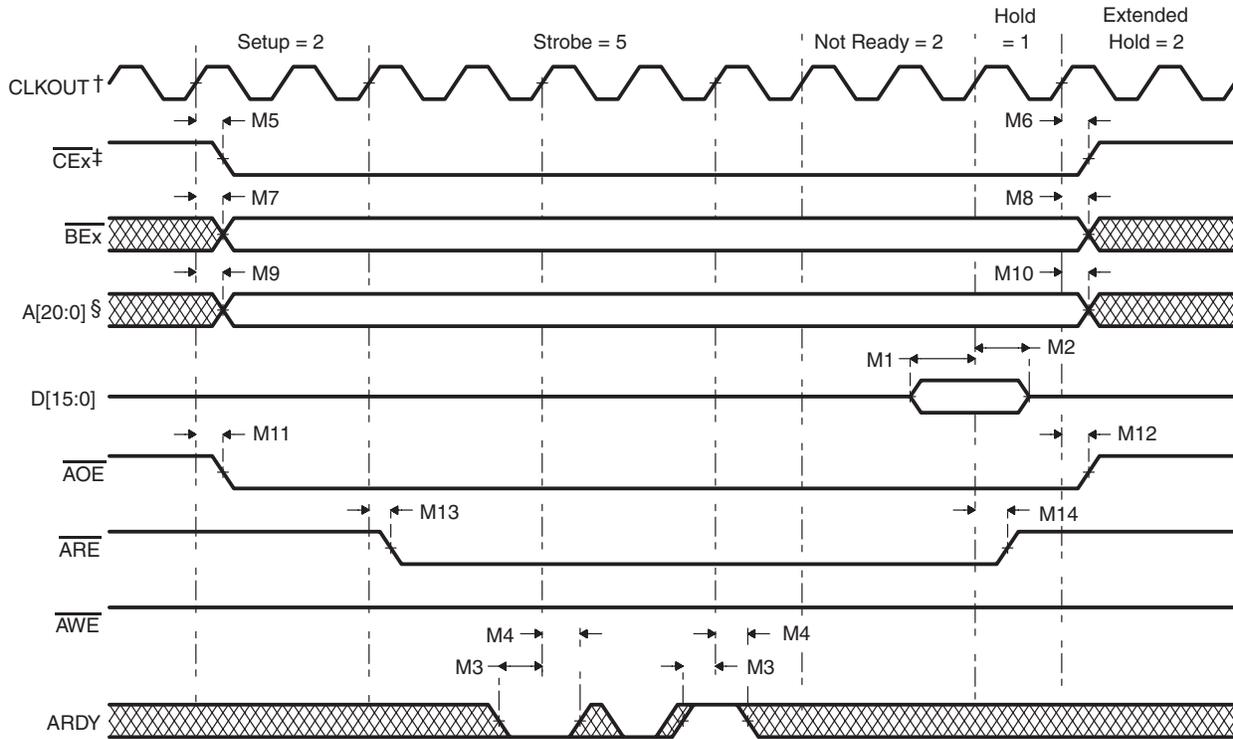

Table 5-7. Asynchronous Memory Cycle Timing Requirements

| NO. | | | $CV_{DD} = 1.2\text{ V}$ $CV_{DD} = 1.35\text{ V}$ | | $CV_{DD} = 1.6\text{ V}$ | | UNIT |
|-----|---------------------|---|---|-----|--------------------------|-----|------|
| | | | MIN | MAX | MIN | MAX | |
| M1 | t_{su} (DV–COH) | Setup time, read data valid before CLKOUT high ⁽¹⁾ | 6 | | 5 | | ns |
| M2 | t_h (COH–DV) | Hold time, read data valid after CLKOUT high | 0 | | 0 | | ns |
| M3 | t_{su} (ARDY–COH) | Setup time, ARDY valid before CLKOUT high ⁽¹⁾ | 10 | | 7 | | ns |
| M4 | t_h (COH–ARDY) | Hold time, ARDY valid after CLKOUT high | 0 | | 0 | | ns |

(1) To ensure data setup time, simply program the strobe width wide enough. ARDY is internally synchronized. If ARDY does not meet setup or hold time, it may be recognized in the current cycle or the next cycle. Thus, ARDY can be an asynchronous input.

Table 5-8. Asynchronous Memory Cycle Switching Characteristics

5.8 Reset Timings

5.8.1 Power-Up Reset (On-Chip Oscillator Active)

Table 5-11 assumes testing over recommended operating conditions (see Figure 5-15).

Table 5-11. Power-Up Reset (On-Chip Oscillator Active) Timing Requirements

| NO. | | CV _{DD} = 1.2 V CV _{DD} = 1.35 V | | CV _{DD} = 1.6 V | | UNIT |
|-----|---|---|-----|--------------------------|-----|------|
| | | MIN | MAX | MIN | MAX | |
| R1 | t _h (SUPSTBL-RSTL) Hold time, $\overline{\text{RESET}}$ low after oscillator stable ⁽¹⁾ | 3P ⁽²⁾ | | 3P ⁽²⁾ | | ns |

(1) Oscillator stable time depends on the crystal characteristic (i.e., frequency, ESR, etc.) which varies from one crystal manufacturer to another. Based on the crystal characteristics, the oscillator stable time can be in the range of a few to 10s of ms. A reset circuit with 100-ms or more delay time will ensure the oscillator stabilized before the $\overline{\text{RESET}}$ goes high.

(2) P = 1/(input clock frequency) in ns. For example, when input clock is 12 MHz, P = 83.33 ns.

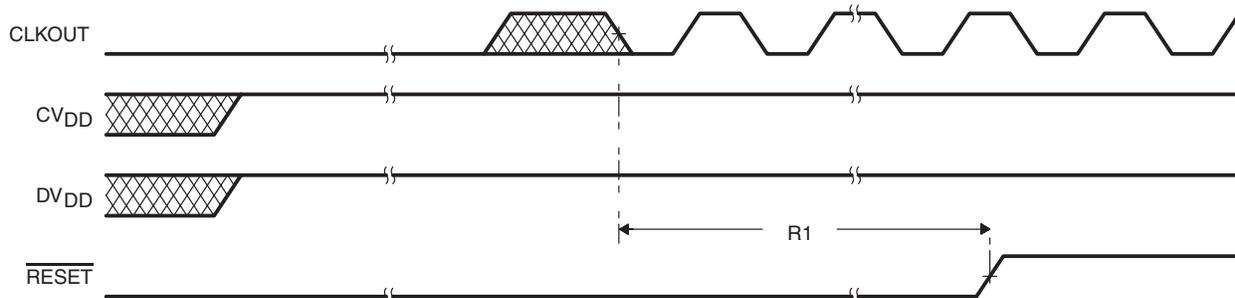

Figure 5-15. Power-Up Reset (On-Chip Oscillator Active) Timings

5.8.2 Power-Up Reset (On-Chip Oscillator Inactive)

Table 5-12 and Table 5-13 assume testing over recommended operating conditions (see Figure 5-16).

Table 5-12. Power-Up Reset (On-Chip Oscillator Inactive) Timing Requirements

- (1) P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.

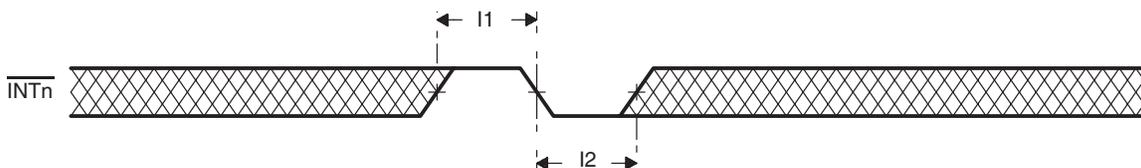

Figure 5-18. External Interrupt Timings

5.10 Wake-Up From IDLE

⁽²⁾assumes testing over recommended operating conditions (see Figure 5-19).

Table 5-17. Wake-Up From IDLE Switching Characteristics⁽¹⁾

| NO. | | | CV _{DD} = 1.2 V CV _{DD} = 1.35 V | | | CV _{DD} = 1.6 V | | | UNIT |
|-----|---------------------------------|--|---|-----|-----|--------------------------|-----|-----|------|
| | | | MIN | TYP | MAX | MIN | TYP | MAX | |
| ID1 | t _d (WKPEVTL–CLKGEN) | Delay time, wake-up event low to clock generation enable (CPU and clock domain idle) | 1.25 ⁽²⁾ | | | 1.25 ⁽²⁾ | | | ms |
| ID2 | t _h (CLKGEN–WKPEVTL) | Hold time, clock generation enable to wake-up event low (CPU and clock domain in idle) | 3P ⁽³⁾ | | | 3P ⁽³⁾ | | | ns |
| ID3 | t _w (WKPEVTL) | Pulse width, wake-up event low (for CPU idle only) | 3P | | | 3P | | | ns |

- (2) P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.
- (1) P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.
- (2) Estimated data based on 12-MHz crystal used with on-chip oscillator at 25°C. This number will vary based on the actual crystal characteristics operating condition and the PC board layout and the parasitics.
- (3) Following the clock generation domain idle, the INTx becomes level-sensitive and stays that way until the low-to-high transition of INTx following the CPU wake-up. Holding the INTx low longer than minimum requirement will send more than one interrupt to the CPU. The number of interrupts sent to the CPU depends on the INTx-low time following the CPU wake-up from IDLE.

| E9 | t _d (HDSH–HRDY)L | Delay time, HDS high to HRDY low (during writes) | | 18 | | 15 | ns |
| E10 | t _d (HDSH–HRDY)H | Delay time, HDS high to HRDY high (during writes) | 14P ⁽¹⁾ (2) | | 14P ⁽¹⁾ (2) | | ns |
| E21 | t _d (COH–HINT) | Delay time, CLKOUT high to HINT high/low | 0 | 11 | 0 | 8 | ns |

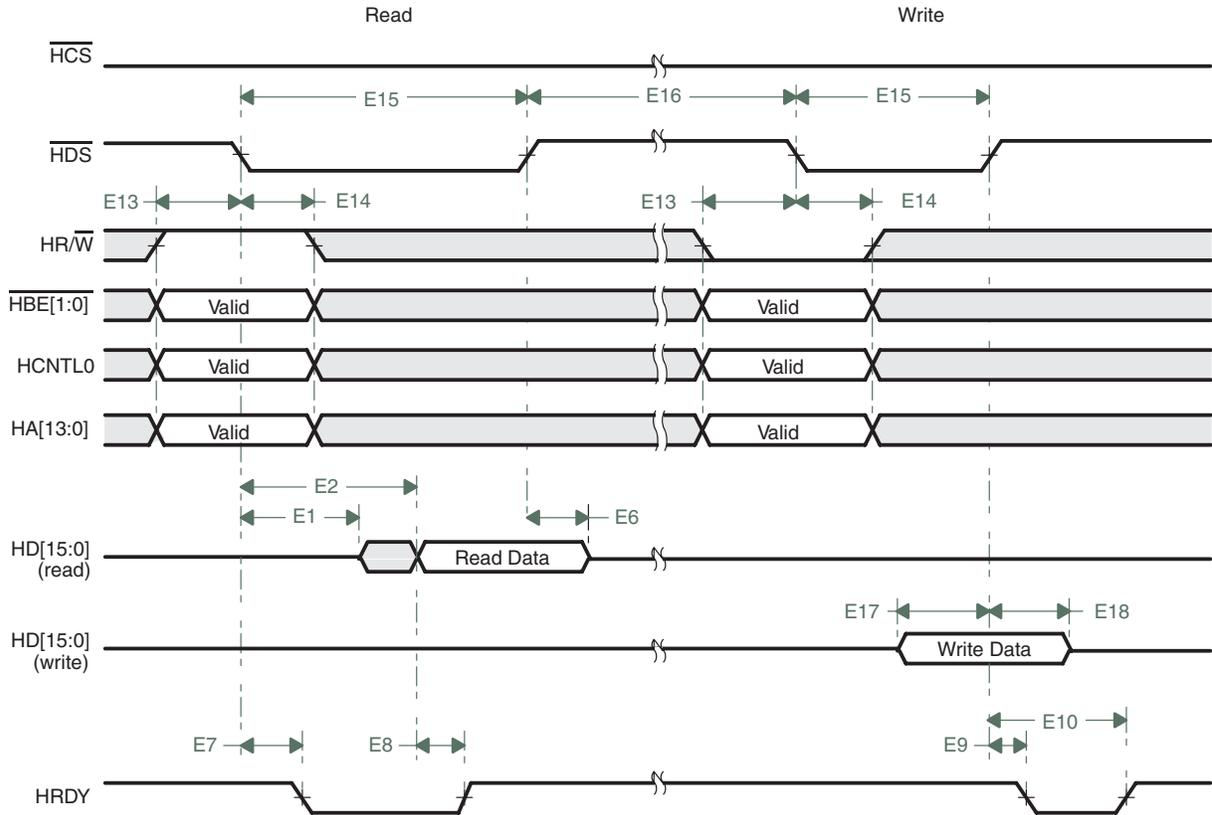

(1) P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.

(2) EHPI latency is dependent on the number of DMA channels active, their priorities and their source/destination ports. The latency shown assumes no competing CPU or DMA activity to the memory resource being accessed by the EHPI.

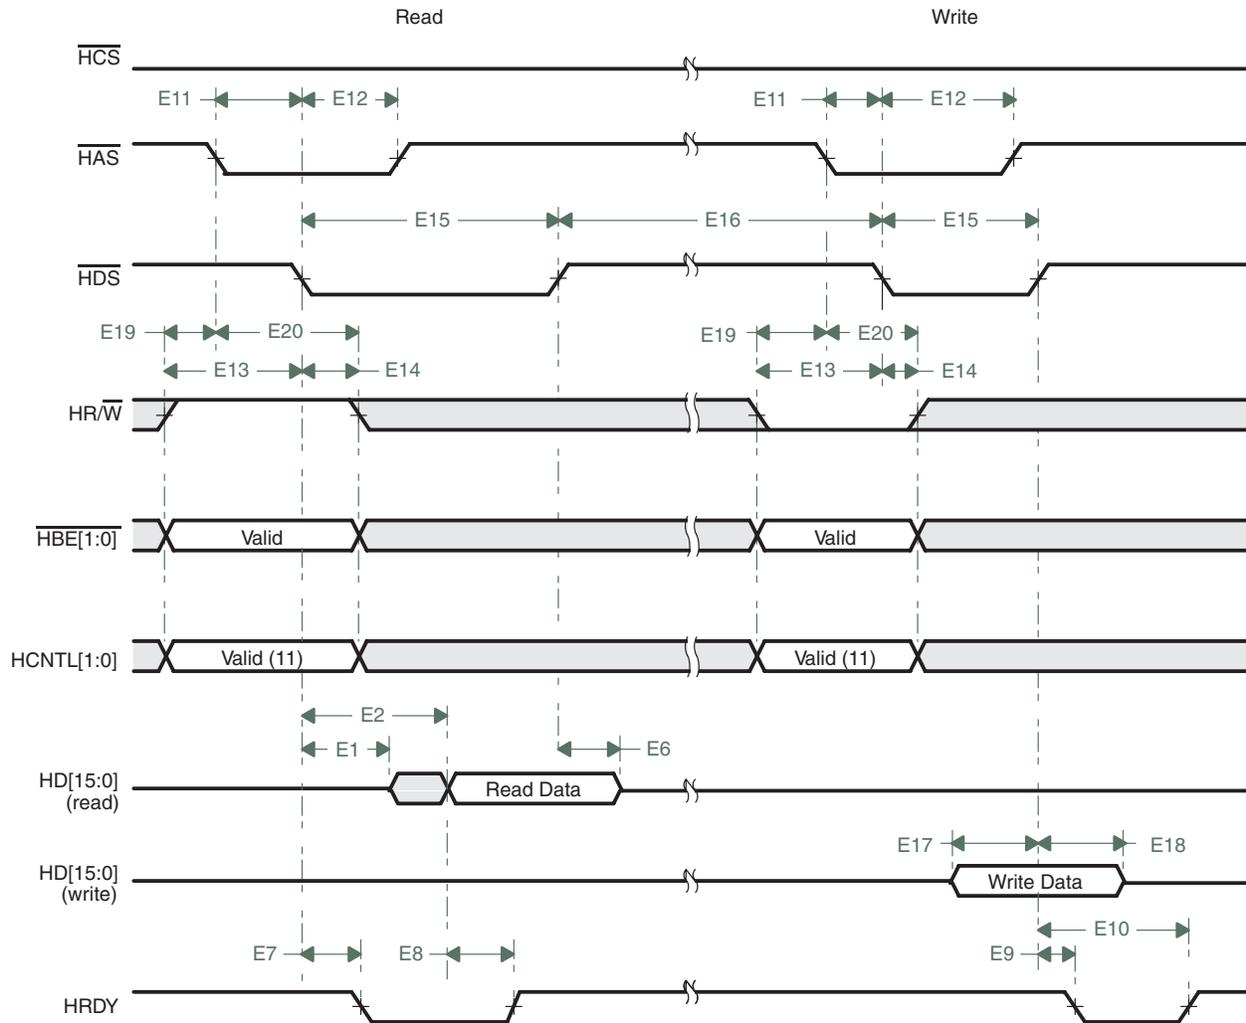

† CLKOUT reflects the CPU clock.

Figure 5-31. $\overline{\text{HINT}}$ Timings

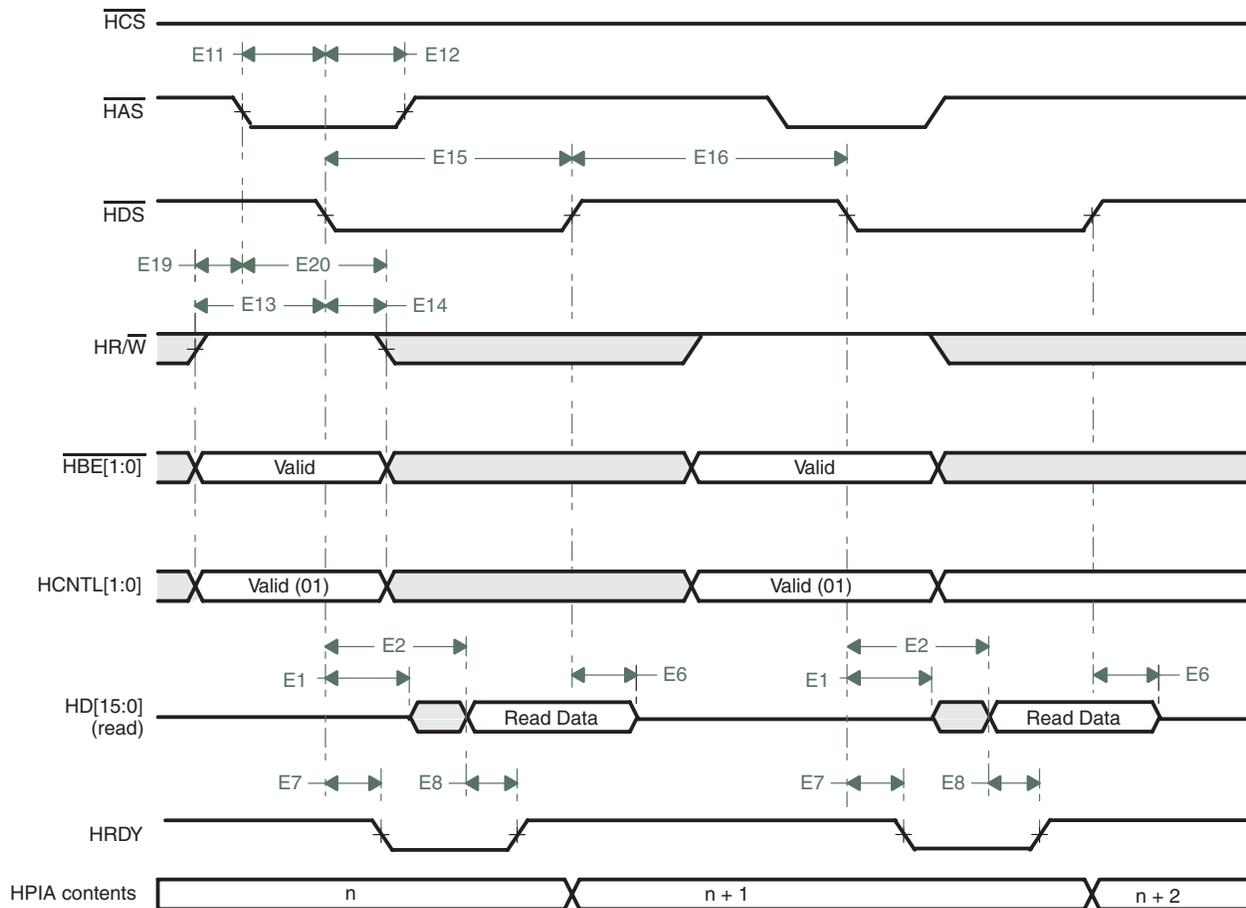

- NOTES: A. Any non-multiplexed access with HCNTL0 low will result in HPIC register access. For data read or write, HCNTL0 must stay high during the EHPI access.
- B. The falling edge of $\overline{\text{HCS}}$ must occur concurrent with or before the falling edge of $\overline{\text{HDS}}$. The rising edge of $\overline{\text{HCS}}$ must occur concurrent with or after the rising edge of $\overline{\text{HDS}}$. If HDS1 and/or HDS2 are tied permanently active and $\overline{\text{HCS}}$ is used as a strobe, the timing requirements shown for $\overline{\text{HDS}}$ apply to $\overline{\text{HCS}}$. HRDY is always driven to the same value as its internal state.

Figure 5-32. EHPI Nonmultiplexed Read/Write Timings

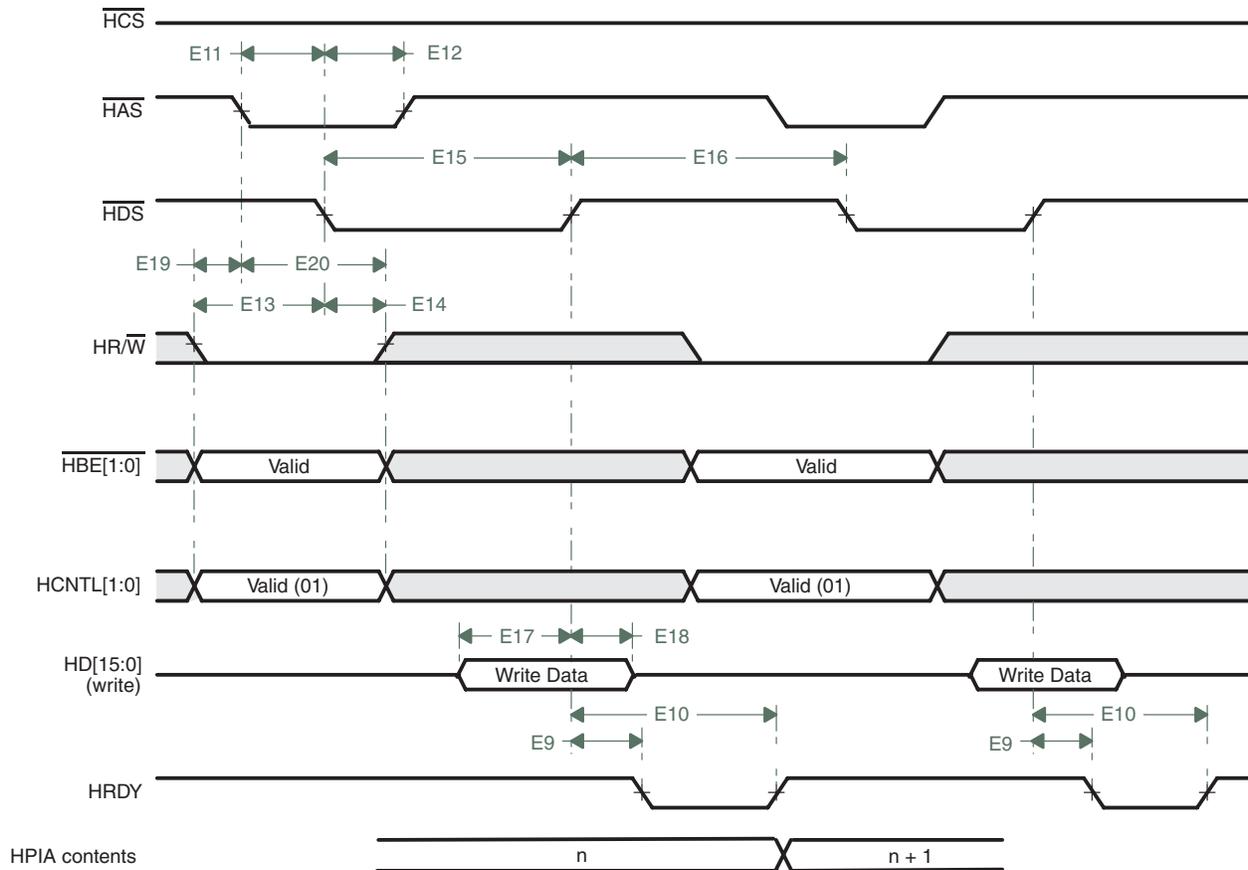

NOTE: The falling edge of $\overline{\text{HCS}}$ must occur concurrent with or before the falling edge of $\overline{\text{HDS}}$. The rising edge of $\overline{\text{HCS}}$ must occur concurrent with or after the rising edge of $\overline{\text{HDS}}$. If $\overline{\text{HDS1}}$ and/or $\overline{\text{HDS2}}$ are tied permanently active and $\overline{\text{HCS}}$ is used as a strobe, the timing requirements shown for $\overline{\text{HDS}}$ apply to $\overline{\text{HCS}}$. $\overline{\text{HRDY}}$ is always driven to the same value as its internal state.

Figure 5-33. EHPI Multiplexed Memory (HPID) Read/Write Timings Without Autoincrement

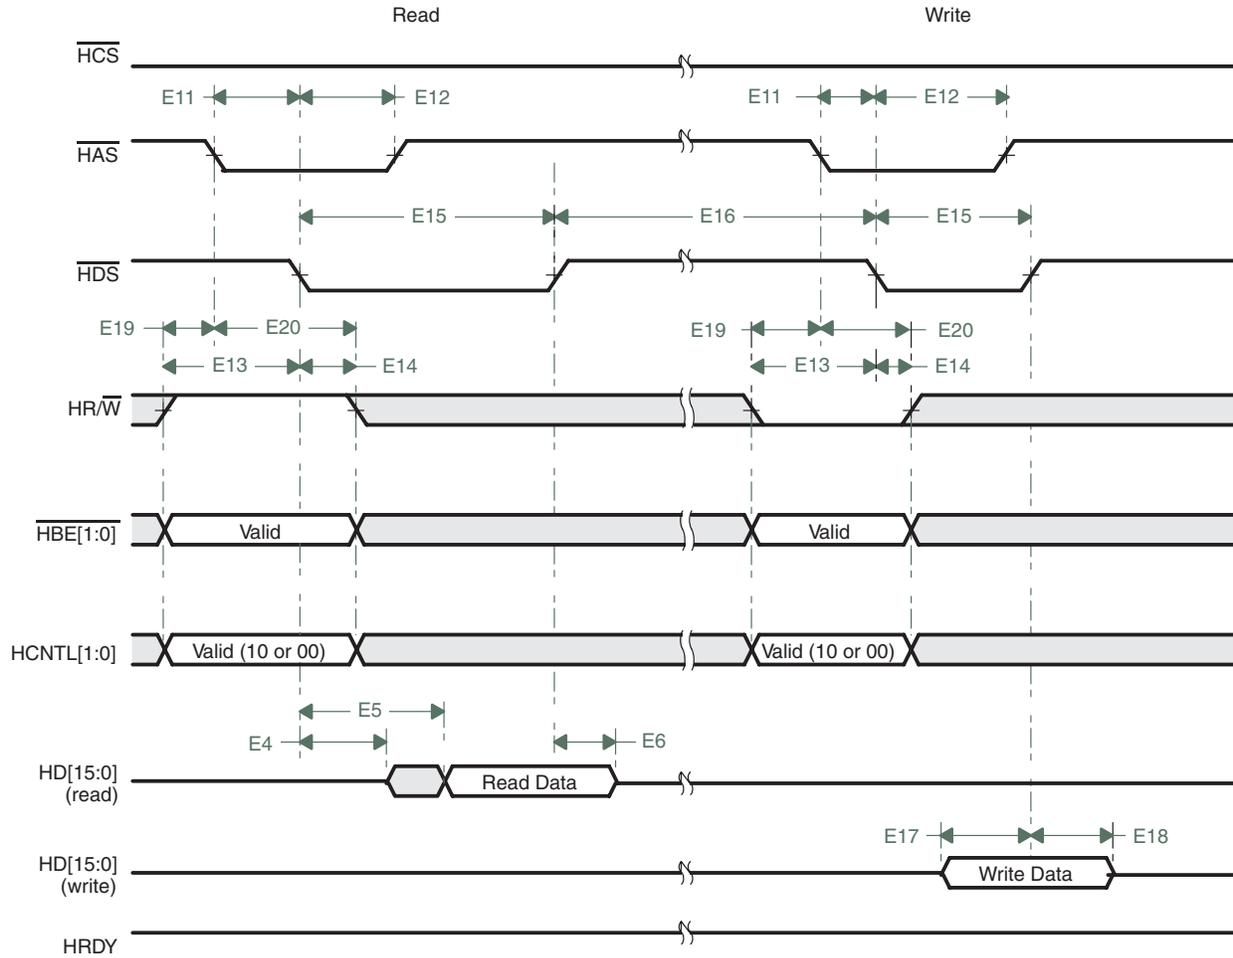

- NOTES:
- A. During autoincrement mode, although the EHPI internally increments the memory address, reads of the HPIA register by the host will always indicate the base address.
 - B. In autoincrement mode, if HBE[1:0] are used to access the data as 8-bit-wide units, the HPIA increments only following each high byte (HBE1 low) access.
 - C. The falling edge of HCS must occur concurrent with or before the falling edge of HDS. The rising edge of HCS must occur concurrent with or after the rising edge of HDS. If HDS1 and/or HDS2 are tied permanently active and HCS is used as a strobe, the timing requirements shown for HDS apply to HCS. HRDY is always driven to the same value as its internal state.

Figure 5-34. EHPI Multiplexed Memory (HPID) Read Timings With Autoincrement

- NOTES: A. During autoincrement mode, although the EHPI internally increments the memory address, reads of the HPIA register by the host will always indicate the base address.
- B. The falling edge of \overline{HCS} must occur concurrent with or before the falling edge of \overline{HDS} . The rising edge of \overline{HCS} must occur concurrent with or after the rising edge of \overline{HDS} . If $\overline{HDS1}$ and/or $\overline{HDS2}$ are tied permanently active and \overline{HCS} is used as a strobe, the timing requirements shown for \overline{HDS} apply to \overline{HCS} . $HRDY$ is always driven to the same value as its internal state.

Figure 5-35. EHPI Multiplexed Memory (HPID) Write Timings With Autoincrement

- NOTES: A. During autoincrement mode, although the EHPI internally increments the memory address, reads of the HPIA register by the host will always indicate the base address.
 B. The falling edge of HCS must occur concurrent with or before the falling edge of HDS. The rising edge of HCS must occur concurrent with or after the rising edge of HDS. If HDS1 and/or HDS2 are tied permanently active and HCS is used as a strobe, the timing requirements shown for HDS apply to HCS. HRDY is always driven to the same value as its internal state.

Figure 5-36. EHPI Multiplexed Register Read/Write Timings

5.16 I²C Timings

Table 5-39 and Table 5-39 assume testing over recommended operating conditions (see Figure 5-37 and Figure 5-38).

Table 5-39. I²C Signals (SDA and SCL) Timing Requirements

| NO. | | | CV _{DD} = 1.2 V CV _{DD} = 1.35 V | | | | CV _{DD} = 1.6 V | | | | UNIT |
|------|-------------------------------|---|---|-----|---------------------------------------|--------------------|--------------------------|-----|---------------------------------------|--------------------|------|

| IC8 | t _w (SDAH) | Pulse duration, SDA high between STOP and START conditions | 4.7 | | 1.3 | | 4.7 | | 1.3 | | μs |
| IC9 | t _r (SDA) | Rise time, SDA | 1000 | | 20 + 0.1C _b ⁽⁴⁾ | 300 | 1000 | | 20 + 0.1C _b ⁽⁴⁾ | 300 | ns |
| IC10 | t _r (SCL) | Rise time, SCL | 1000 | | 20 + 0.1C _b ⁽⁴⁾ | 300 | 1000 | | 20 + 0.1C _b ⁽⁴⁾ | 300 | ns |
| IC11 | t _f (SDA) | Fall time, SDA | 300 | | 20 + 0.1C _b ⁽⁴⁾ | 300 | 300 | | 20 + 0.1C _b ⁽⁴⁾ | 300 | ns |
| IC12 | t _f (SCL) | Fall time, SCL | 300 | | 20 + 0.1C _b ⁽⁴⁾ | 300 | 300 | | 20 + 0.1C _b ⁽⁴⁾ | 300 | ns |
| IC13 | t _{su} (SCLH–SDAH) | Setup time, SCL high before SDA high (for STOP condition) | 4 | | 0.6 | | 4 | | 0.6 | | μs |
| IC14 | t _w (SP) | Pulse duration, spike (must be suppressed) | | | 0 | 50 | | | 0 | 50 | ns |
| IC15 | C _b ⁽⁴⁾ | Capacitive load for each bus line | | 400 | | 400 | | 400 | | 400 | pF |

- (1) A Fast-mode I²C-bus device can be used in a Standard-mode I²C-bus system, but the requirement t_{su(SDA-SCLH)} ≥ 250 ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line tr max + t_{su(SDA-SCLH)} = 1000 + 250 = 1250 ns (according to the Standard-mode I²C-Bus Specification) before the SCL line is released.
- (2) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- (3) The maximum t_{h(SDA-SCLL)} has only to be met if the device does not stretch the LOW period [t_{w(SCLL)}] of the SCL signal.
- (4) C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

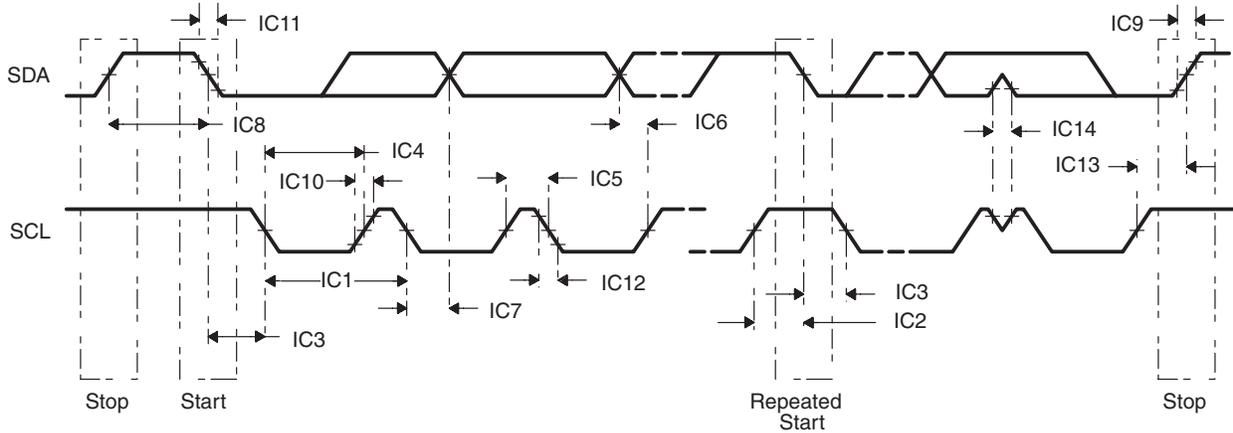

Figure 5-37. I²C Receive Timings

- (1) C_L = 50 pF
- (2) (t_r/t_f) x 100
- (3) t_{px(1)} - t_{px(0)}
- (4) USB PLL is susceptible to power supply ripple, refer to recommend operating conditions for allowable supply ripple to meet the USB peak-to-peak jitter specification.

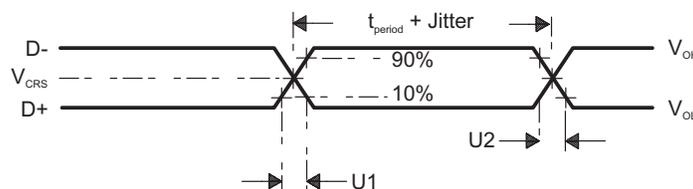

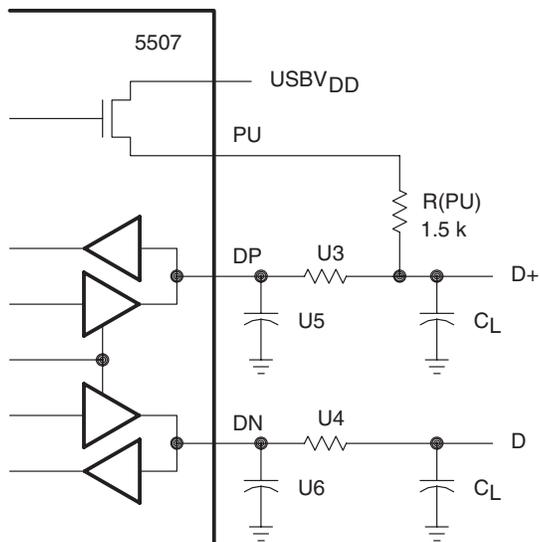

Figure 5-39. USB Timings

NOTES: A. A full-speed buffer is measured with the load shown.
 B. $C_L = 50 \text{ pF}$

Figure 5-40. Full-Speed Loads

5.18 ADC Timings

Table 5-42 assumes testing over recommended operating conditions.

Table 5-42. ADC Characteristics

| NO. | | $CV_{DD} = 1.2 \text{ V}$ $CV_{DD} = 1.35 \text{ V}$ | | $CV_{DD} = 1.6 \text{ V}$ | | UNIT |
|-----|--|---|--------------------|---------------------------|--------------------|---------------|
| | | MIN | MAX | MIN | MAX | |
| A1 | $t_{c(SCLC)}$ Cycle time, ADC internal conversion clock | 500 | | 500 | | ns |
| A2 | $t_{d(AQ)}$ Delay time, ADC sample and hold acquisition time | | 40 | | 40 | μs |
| A3 | $t_{d(CONV)}$ Delay time, ADC conversion time | | $13 * t_{c(SCLC)}$ | | $13 * t_{c(SCLC)}$ | ns |
| A4 | S_{DNL} | Static differential non-linearity error | | 2 | | LSB |
| | | Static integral non-linearity error | | 3 | | |
| A5 | Z_{set} Zero-scale offset error | | 9 | | 9 | LSB |
| A6 | F_{set} Full-scale offset error | | 9 | | 9 | LSB |
| A7 | Analog input impedance | 1 | | 1 | | MW |

6 Mechanical Data

6.1 Package Thermal Resistance Characteristics

Table 6-1 and Table 6-2 provide the estimated thermal resistance characteristics for the SM320VC5507 DSP package types.

Table 6-1. Thermal Resistance Characteristics (Ambient)

| PACKAGE | $R_{\Theta JA}$ (°C/W) | BOARD TYPE ⁽¹⁾ | AIRFLOW (LFM) |
|---------|------------------------|---------------------------|---------------|
| PGE | 71.2 | High-K | 0 |
| | 61.8 | High-K | 150 |
| | 58.9 | High-K | 250 |
| | 54.8 | High-K | 500 |
| | 103.6 | Low-K | 0 |
| | 84.2 | Low-K | 150 |
| | 77.8 | Low-K | 250 |
| | 69.4 | Low-K | 500 |

(1) Board types are as defined by JEDEC. Reference JEDEC Standard JESD51-9, Test Boards for Area Array Surface Mount Package Thermal Measurements.

Table 6-2. Thermal Resistance Characteristics (Case)

| PACKAGE | $R_{\Theta JA}$ (°C/W) | BOARD TYPE ⁽¹⁾ |
|---------|------------------------|---------------------------|
| PGE | 13.8 | 2s JEDEC Test Card |

(1) Board types are as defined by JEDEC. Reference JEDEC Standard JESD51-9, Test Boards for Area Array Surface Mount Package Thermal Measurements.

6.2 Packaging Information

The following packaging information reflects the most current released data available for the designated device(s). This data is subject to change without notice and without revision of this document.

PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead finish/ Ball material (6) | MSL Peak Temp (3) | Op Temp (°C) | Device Marking (4/5) | Samples |
|-------------------|---------------|--------------|--------------------|------|----------------|-----------------|--------------------------------------|----------------------|--------------|-------------------------|-------------------------|
| SM320VC5507PGESEP | ACTIVE | LQFP | PGE | 144 | 60 | RoHS & Green | NIPDAU | Level-4-260C-72 HR | -55 to 85 | SM320 VC5507PGESEP | Samples |
| V62/09647-01XA | ACTIVE | LQFP | PGE | 144 | 60 | RoHS & Green | NIPDAU | Level-4-260C-72 HR | -55 to 85 | SM320 VC5507PGESEP | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

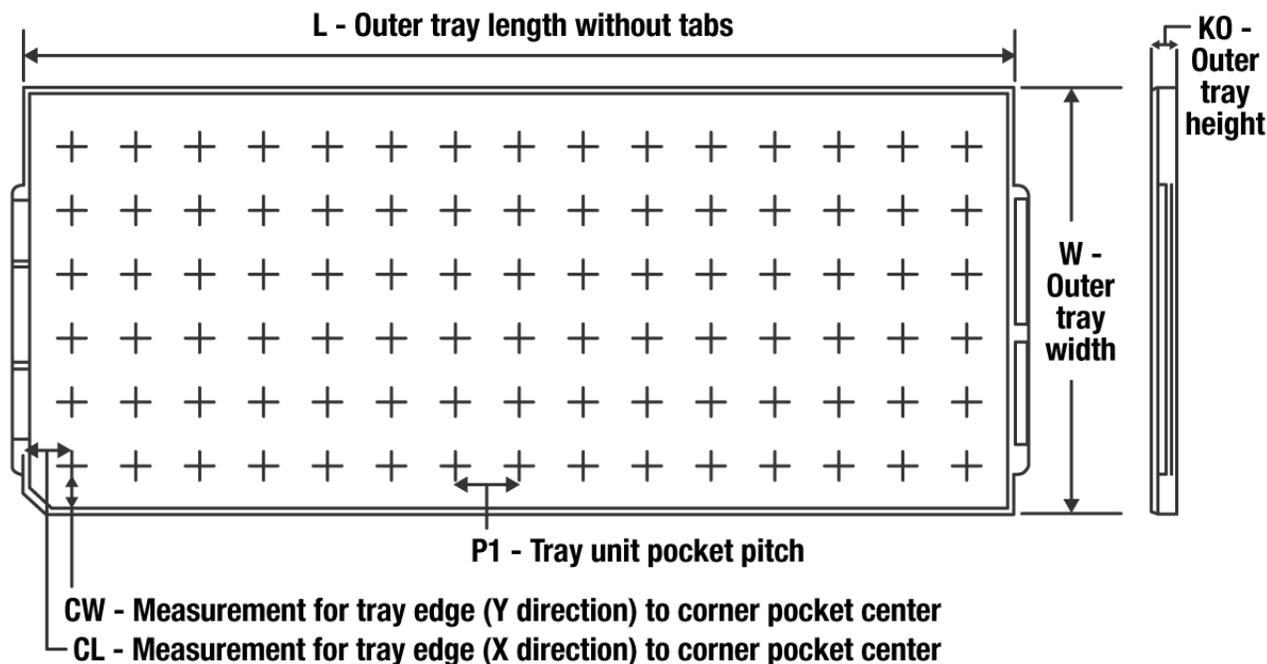

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TRAY

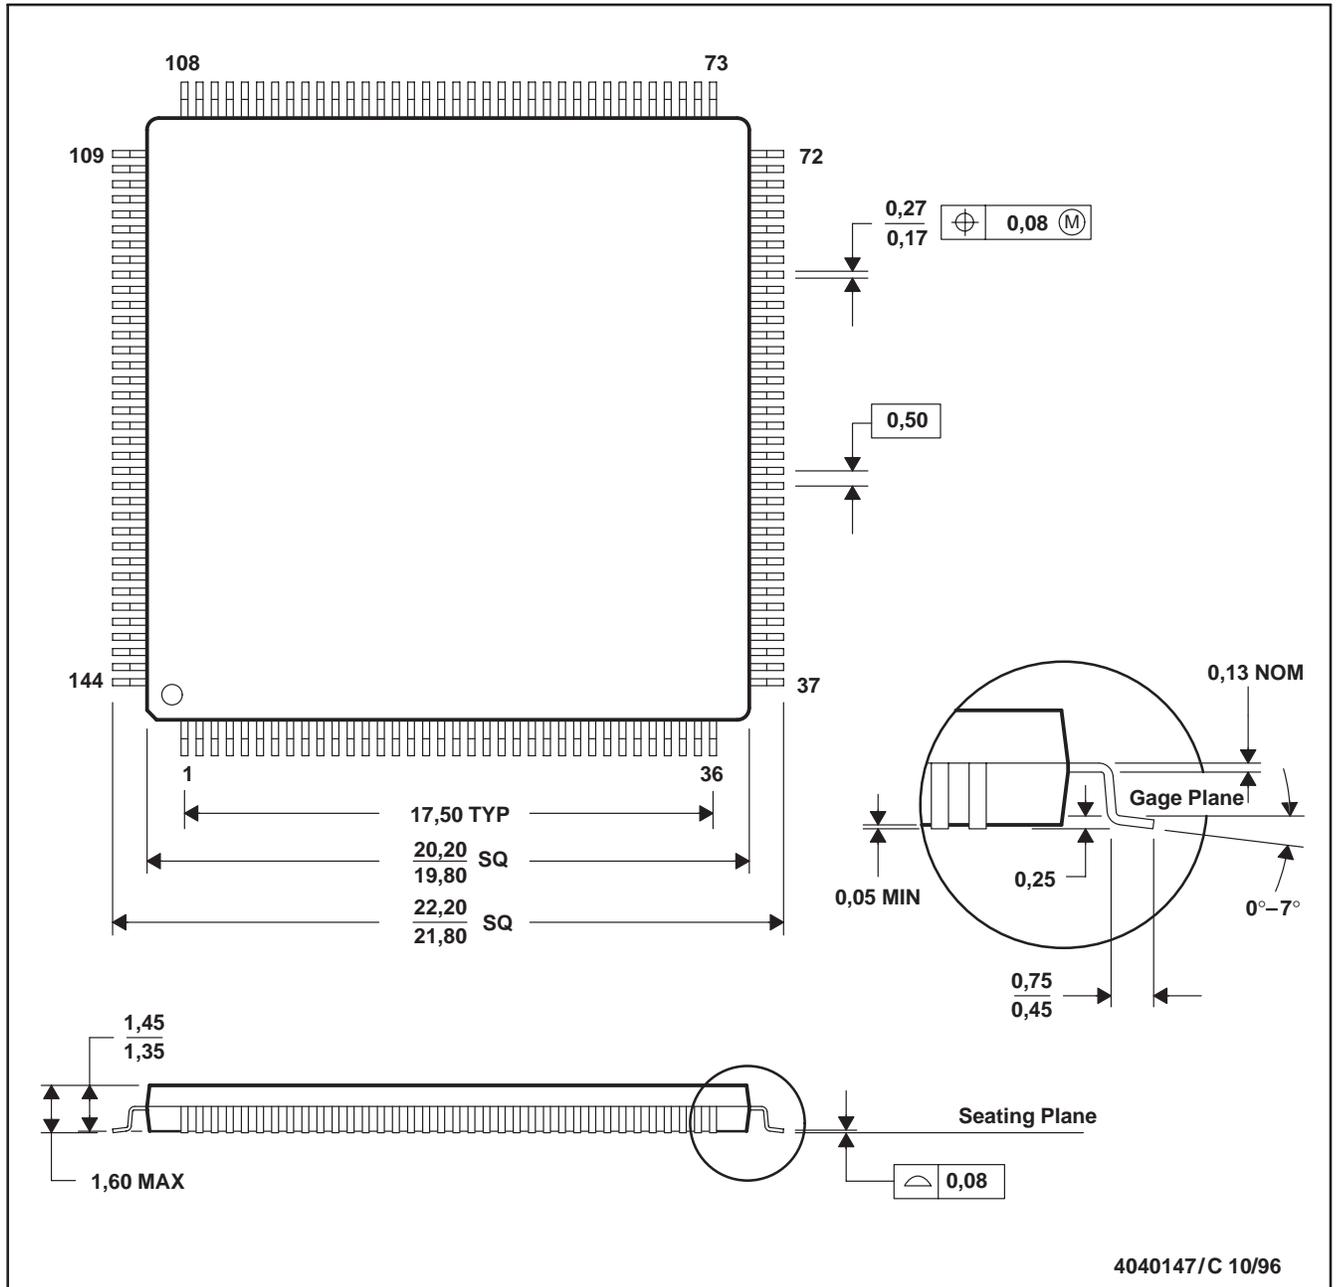

Chamfer on Tray corner indicates Pin 1 orientation of packed units.

*All dimensions are nominal

| Device | Package Name | Package Type | Pins | SPQ | Unit array matrix | Max temperature (°C) | L (mm) | W (mm) | K0 (µm) | P1 (mm) | CL (mm) | CW (mm) |
|-------------------|--------------|--------------|------|-----|-------------------|----------------------|--------|--------|---------|---------|---------|---------|
| SM320VC5507PGESEP | PGE | LQFP | 144 | 60 | 5X12 | 150 | 315 | 135.9 | 7620 | 25.4 | 17.8 | 17.55 |
| V62/09647-01XA | PGE | LQFP | 144 | 60 | 5X12 | 150 | 315 | 135.9 | 7620 | 25.4 | 17.8 | 17.55 |
