

XGZP6897D PRESSURE SENSOR

FEATURES

- Wide Ranges: -100kPa...-0.5 ~ 0 ~ 0.5...200kPa(show in [Pressure Range Example](#))
- 2.7V ~ 5.5V Power Supply
- Differential Pressure Type
- For Non-corrosive Gas or Air
- Calibrated Digital Signal(I2C Interface)(Refer to XGZP6897A for Analog signal)
- Temp. Compensated: 0°C ~ +60°C(32°F ~ +140°F)
- Temperature Measurable
- Affordable Cost, Easy-to-use

✓ **RoHS**

APPLICATIONS

- Medical&Healthcare
- Industrial&Automation
- Domestic Appliance
- Consumer Electronic
- Air Flow or Wind Pressure Measurement

INTRODUCTION

XGZP6897D is a perfect silicon pressure sensor offering a ratiometric digital data(I2C interface) for reading differential pressure over the specified full scale pressure span.

The XGZP6897D incorporates a silicon piezoresistive pressure sensor chip and an interior signal-conditional Application Specific Integrated Circuit(ASIC) in a SOP8 package with two air vents, which can be mounted directly on a standard PCB.

The XGZP6897D is fully calibrated and temperature compensated for specified span, so XGZP6897D pressure sensor satisfy the perfect accuracy, which is designed for a wide range of application in medical care&health, home appliances, consumer electronic, industry, air flow measurement, IoT and other pneumatic devices/meters etc by utilizing a microcontroller or microprocessor with I2C interface.

XGZP6897D pressure sensor is for high volume application at an affordable cost and perfect performance. Customized calibration parameter (e.g.pressure range etc.) are available.

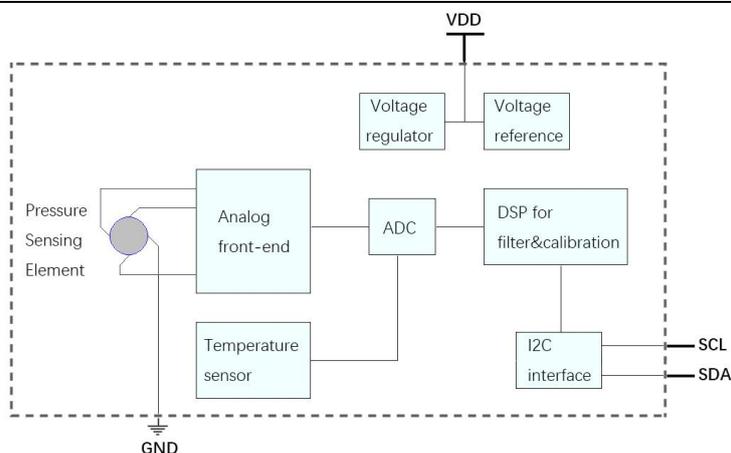

PERFORMANCE SPECIFICATION

Unless otherwise specified, measurements were taken by 3.3Vdc with temperature of 25±1°C and humidity from 25% ~ 85 % RH.

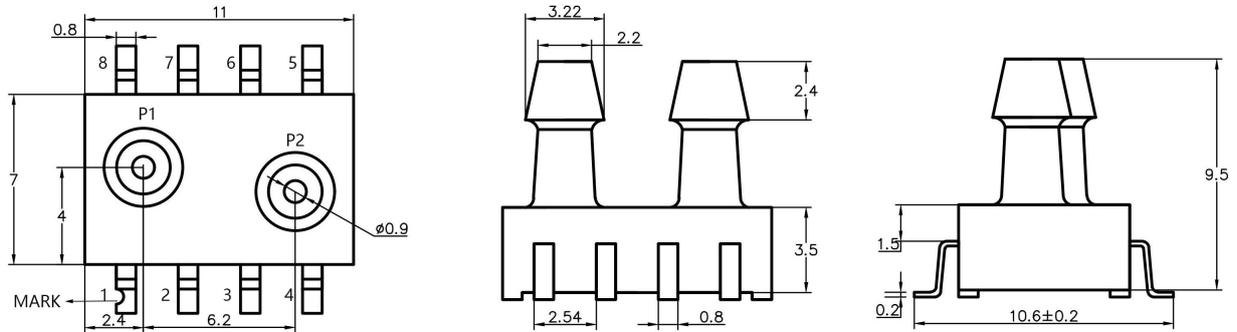

CHARACTERISTIC		MIN.	TYP.	MAX	UNIT
Available Pressure Range ^①		-100...-0.5 ~ 0 ~ 0.5...200			kPa
Power Supply ^②		2.7	3.3	5.5	Vdc
Current Consumption	Operating Current	-	1.8	-	mA
	Standby Current	-	100	-	nA
Output Resolution ^③	Pressure	21			Bit
	Temperature	16			Bit
Total Accuracy	10kPa < Pressure ≤ 200kPa	-	-	±2	%FSS
	Pressure ≤ 10kPa or > 200kPa	-	-	±2.5	%FSS
Temperature Accuracy		-1		1	°C
Offset Drift after Soldering		-	-	±1	%FSS
Long Term Stability(1000 hr, 25°C)		-	-	±0.5	%FSS
Over Pressure ^④	Pressure ≤ 5kPa	-	5X	-	FSS
	5kPa < Pressure ≤ 200kPa	-	2.5X	-	FSS
Burst Pressure ^④	Pressure ≤ 5kPa	-	10X	-	FSS
	5kPa < Pressure ≤ 200kPa	-	3X	-	FSS
Pressure on P2 Port(Common mode pressure)		-	-	250	kPa
Compensation Temperature		0	-	60	°C
Operating Temperature		-30	-	105	°C
Storage Temperature		-40	-	125	°C
ESD Protection(Human Body Mode)		-	±2000	-	V
Response Time(Normal mode)		-	5	-	mS

- ① The range cover all pressure ranges as shown as "PRESSURE RANGE EXAMPLE" list.
- ② Overload voltage(6.5Vdc above) or current(5mA above) may burn the IC and cause the sensor failure thoroughly.
- ③ The highest data bit as the signed number.
- ④ The indicated value is widespread value, contact CFsensor for more information on specific pressure range.

BLOCK DIAGRAM

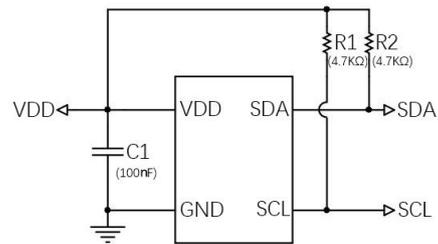

DDIMENSION(Unit:mm Unspecified Tolerances:±0.1mm)

Note: Port 1(P1) as High pressure cavity, and Port 2(P2) as Low pressure cavity.

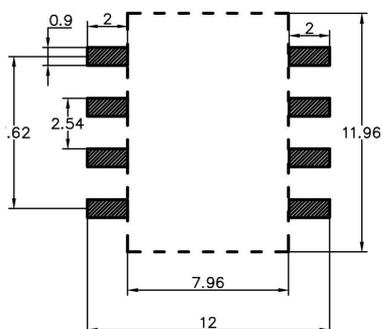

PIN DEFINITION

PIN2	PIN6	PIN7	PIN8	PIN1/3/4/5
VDD	SDA	SCL	GND	N/C
SCL	The clock signal			
NC	Do not connect to external circuitry or ground			
GND	Ground			
VDD	Voltage supply			
SDA	Data signal(Send& Receive)

PRESSURE RANGE EXAMPLE

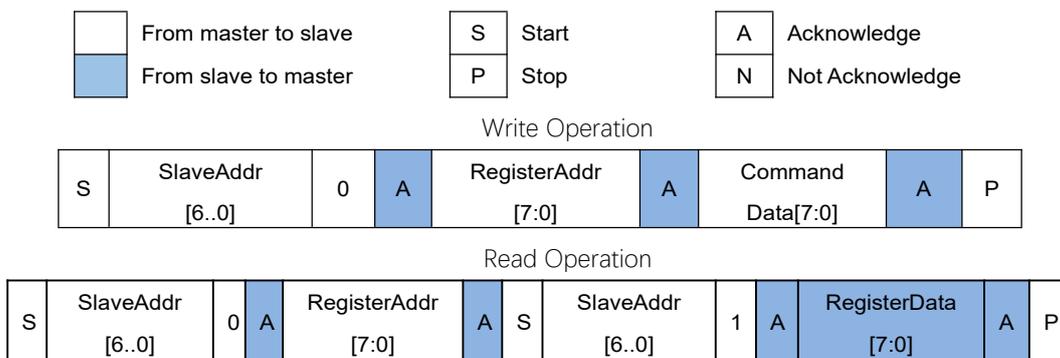

- Notes: 1. Unit conversion: 1000hPa=100kPa=0.1MPa=1000mbar=1bar≈750mmHg≈14.5PSI≈10mH₂O;
 2. Available for more custom pressure range e.g. -7 ~ 7kPa, , 0-250Pa etc..

Pressure Range (kPa)	Pressure Range (by other units)	Part Number
-0.25 ~ 0.25	250 ~ 250Pa	XGZP6897DC2.5HPDPN
-0.5 ~ 0.5	-5 ~ 5mbar / 500 ~ 500Pa	XGZP6897DC005HPDPN
-1 ~ 1	-10 ~ 10mbar / -100 ~ 100mmH ₂ O	XGZP6897DC001KPDPN
-2.5 ~ 2.5	-25 ~ 25mbar / -250 ~ 250mmH ₂ O	XGZP6897DC025HPDPN
-5 ~ 5	-50 ~ 50mbar / -500 ~ 500mmH ₂ O	XGZP6897DC005KPDPN
-10 ~ 10	-100 ~ 100mbar / -75 ~ 75mmHg	XGZP6897DC010KPDPN
-50 ~ 50	-500 ~ 500mbar / -375 ~ 375mmHg	XGZP6897DC050KPDPN
-100 ~ 0	-1 ~ 0bar / -14.5 ~ 0PSI	XGZP6897DC100KPDN
0 ~ 1	0 ~ 10mbar / 0 ~ 100mmH ₂ O	XGZP6897DC010HPDG
0 ~ 2.5	0 ~ 25mbar / 0 ~ 250mmH ₂ O	XGZP6897DC025HPDG
0 ~ 5	0 ~ 50mbar / 0 ~ 500mmH ₂ O	XGZP6897DC005KPDG
0 ~ 10	0 ~ 100mbar / 0 ~ 75mmHg	XGZP6897DC010KPDG
0 ~ 20	0 ~ 200mbar / 0 ~ 150mmHg	XGZP6897DC020KPDG
0 ~ 40	0 ~ 400mbar / 0 ~ 300mmHg	XGZP6897DC040KPDG
0 ~ 50	0 ~ 500mbar / 0 ~ 375mmHg	XGZP6897DC050KPDG
0 ~ 100	0 ~ 1bar / 0 ~ 14.5PSI	XGZP6897DC100KPDG

★ Above P/N is example only, consult CFSensor whether required pressure range is under normal production before place order.

I2C INTERFACE

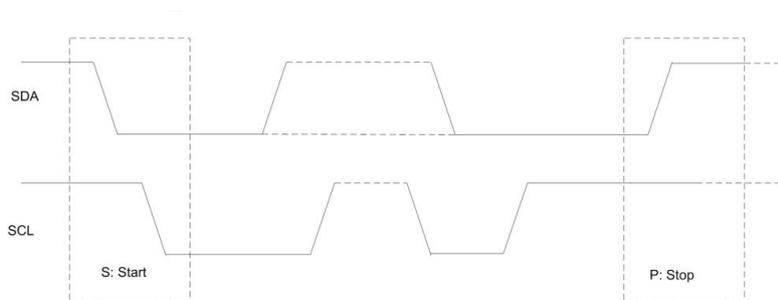

The I2C bus uses SCL and SDA as signal lines, both of which are connected to VDD through pull-up resistors (typ.value: 2.2K) and remain high level when not communicating. I2C device factory setting slave address: **0X58**

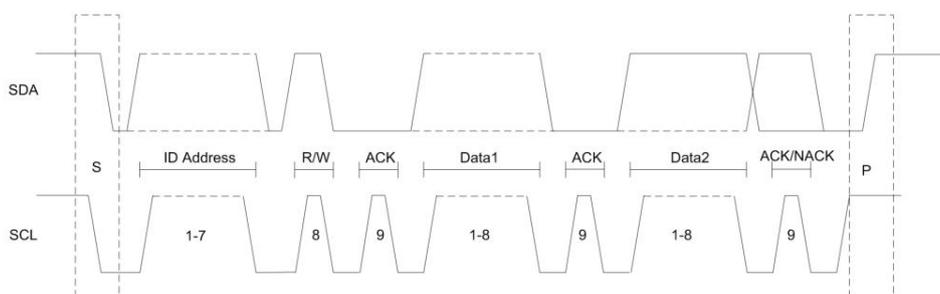

I2C TIME DIAGRAM

The I2C interface protocol has special bus signal conditions. Start (S), stop (P) and binary data conditions are shown below. At start condition, SCL is high and SDA has a falling edge. Then the slave address is sent. After the 7 address bits, the direction control bit R/W selects the read or write operation. When a slave device recognizes that it is being addressed, it should acknowledge by pulling SDA low in the ninth SCL (ACK) cycle.

At stop condition, SCL is also high, but SDA has a rising edge. Data must be held stable at SDA when SCL is high. Data can change value at SDA only when SCL is low.

I2C PROTOCOL

PRESSURE CALCULATION

Read the pressure data from 0x04 to 0x06 register, the calculation formula for the actual pressure is as below:

$$\text{Sum} = (0x04 \text{ value} * 2^{16} + 0x05 \text{ value} * 2^8 + 0x06 \text{ value}),$$

$$\text{If sum} < 8388608, P = \text{sum} / 2^{21} * (\text{P}_{\text{MAX}} - \text{P}_{\text{MIN}}) \quad (\text{Unit: Pa})$$

$$\text{If sum} \geq 8388608, P = (\text{sum} - 2^{24}) / 2^{21} * (\text{P}_{\text{MAX}} - \text{P}_{\text{MIN}}) \quad (\text{Unit: Pa})$$

P_{MAX} and P_{MIN} Definition

Range	P _{MIN}	P _{MAX}	Example(Unit: Pa)
Positive	0	Upper Range	0~10kPa: P _{MIN} =0, P _{MAX} :10000
Negative	Lower Range	0	-20~0kPa: P _{MIN} = -20000, P _{MAX} :0
N to P	Lower Range	Upper Range	-1~1kPa: P _{MIN} = -1000, P _{MAX} :1000

TEMPERATURE CALCULATION

Read the pressure data from 0x07 and 0x08 register, the calculation formula for the actual temperature is as below:

$$\text{Final}_T = (\text{Inter}_T - \text{Byte1}) / 2^{\text{Shift}_N} + 25$$

The specific calculation steps are as follows:

1, $\text{Inter}_T = \text{RAW}_T - 65536$ ($\text{RAW}_T > 32768$); otherwise, $\text{Inter}_T = \text{RAW}_T$, where

$$\text{RAW}_T = 0x07 \text{ value} * 2^8 + 0x08 \text{ value}$$

2, Byte1 is calculated from the 0x20 register value, where

Bits [6:0] are used as the exponent of 2,

Bit [7] is the sign bit, when bit [7] = 1, Byte1 is a negative value, when bit [7] = 0, Byte1 is a positive value.

Assumed the value of 0x20 register is 0x8D (i.e. 10001101), according to the above description, the exponent is 13, the sign bit is negative, so the value of Byte1 is $-(2^{13})$, i.e. -8192.

3, $\text{Shift}_N = \text{Byte2} / 10$, where Byte2 is the 0x21 register value. Assumed the value of 0x21 register is 0x46,

then $\text{Shift}_N = 70 / 10 = 7$.

PACKING INFORMATION

Tube Packing

Packing	Plastic Tube	Inner Box	Note
Quantity	45PCS per tube	1800pcs(40pcs tube)	Anti-static bag

Note: The sensor should be stored in an ESD protective container before using them.

OVERALL NOTES

Unless otherwise specified, following notes are general attention or presentation for all products from CFSensor.

Mounting

The following steps is for transmitting the air pressure to sensor after sensor soldering on PCB.

- ▼ For some sensors that come with inlet tube, select the flexible pipe to suit the pressure inlet that is firm enough to prevent the pressure leaks.
- ▼ Atmosphere hole (for Gauge type sensors) and Inlet pipe/hole can't be blocked with gel or glue etc...
- ▼ Avoiding excessive external force operation

Soldering

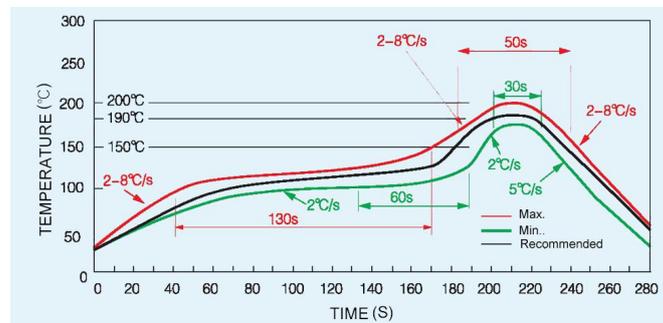

Due to its small size, the thermal capacity of the pressure sensor is low. Therefore, take steps to minimize the effects of external heat. Damage and changes to characteristics may occur due to heat deformation. Use a non-corrosive resin type of flux. Since the pressure sensor is exposed to the atmosphere, do not allow flux to enter inside.

▼ Manual soldering

- Raise the temperature of the soldering tip to 190°C max. and solder within 5 seconds.
- The sensor output may vary if the load is applied on the terminal during soldering.
- Keep the soldering tip clean.

▼ Reflow soldering (SMD Terminal)

- Considering the thermal effect on offset drift for the low pressure range, the Low Temperature Soldering curve are recommended as below.

- Self alignment may not always work as expected, therefore, please carefully the position of the terminals and pattern.

○ The temperature of the profile is assumed to be a value measured with the printed wiring board of the terminal neighborhood.

○ Please evaluate solderability under the actual mounting conditions since welding and deformation of the pressure inlet port may occur due to heat stress depending on equipments or conditions.

▼ Rework soldering

- Complete rework at a time.
- Use a flattened soldering tip when performing rework on the solder bridge. Do not add the flux.
- Keep the soldering tip below the temperature described in the specifications.

▼ Avoid drop and rough handling as excessive force may deform the terminal and damage soldering characteristics.

▼ Keep the circuit board warpage within 0.05 mm of the full width of the sensor.

▼ After soldering, do not apply stress on the soldered part when cutting or bending the circuit board.

▼ Prevent human hands or metal pieces from contacting with the sensor terminal. Such contact may cause anomalous

outlets as the terminal is exposed to the atmosphere.

▼ After soldering, prevent chemical agents from adhering to the sensor when applying coating to avoid insulation deterioration of the circuit board.

Connecting

▼ Correctly wire as in the connection diagram. Reverse connection may damage the product and degrade the performance.

▼ Do not use idle terminals(N/C) to prevent damages to the sensor.

Cleaning

▼ Since the pressure sensor is exposed to the atmosphere, do not allow cleaning fluid to enter inside from atmosphere hole (for Gauge type sensors) and inlet pipe.

▼ Avoid ultrasonic cleaning since this may cause breaks or disconnections in the wiring.

Environment

▼ Please avoid using or storing the pressure sensor in a place exposed to corrosive gases (such as the gases given off by organic solvents, sulfurous acid gas, hydrogen sulfides, etc.) which will adversely affect the performance of the pressure sensor chip.

▼ Since this pressure sensor itself does not have a water-proof construction(even available media can be liquid), please do not use the sensor in a location where it may be sprayed with water, etc.

▼ Avoid using the pressure sensors in an environment where condensation may form. Furthermore, its output may fluctuate if any moisture adhering to it freezes.

▼ The pressure sensor is constructed in such a way that its output will fluctuate when it is exposed to light. Especially when pressure is to be applied by means of a transparent tube, take steps to prevent the pressure sensor chip from being exposed to light.

▼ Avoid using pressure sensor where it will be susceptible to ultrasonic or other high-frequency vibration.

▼ Keeping the sensors sealed in static shielding bags with an oxygen-free condition and use the sensor as soon as possible once unfold the package, because the sensors' PINs may be oxidated a bit under atmosphere environment(slight oxidation wouldn't affect soldering and performance)

More Precautions

▼ That using the wrong pressure range or mounting method may result in accidents.

▼ The only direct pressure medium you can use is non-corrosive gas or air as illuminated above(Note: some sensors are compatible with liquid media). The use of other media, in particular, corrosive gases and liquid (organic solvent based, sulfurous acid based, and hydrogen sulfide based, etc.) or contains foreign substances will cause malfunction and damage. Please do not use them and check with CFsensor.

▼ The pressure sensor is positioned inside the pressure inlet. Never poke wires or other foreign matter through the pressure inlet since they may damage the sensor or block the inlet. Avoid use when the atmospheric pressure inlet(only for Gauge type pressure sensor) is blocked.

▼ Use an operating pressure which is within the rated pressure range. Using a pressure beyond this range may cause damage.

▼ Since static charge can damage the pressure sensor, bear in mind the following handling precautions.

⊙ When storing the pressure sensor, use a conductive material to short the pins or wrap the entire sensor in aluminum foil. Common plastic containers should not be used to store or transport the sensor since they readily become charged.

⊙ When using the pressure sensor, all the charged articles on the bench surface and the work personnel should be grounded so that any ambient static will be safely discharged.

▼ Based on the pressure involved, give due consideration to the securing of the pressure sensor.

【 SAFETY NOTES 】

Using these sensors products may malfunction due to external interference and surges, therefore, please confirm the performance and quality in actual use. Just in case, please make a safety design on the device (fuse, circuit breaker, such as the installation of protection circuits, multiple devices, etc.), so it would not harm life, body, property, etc even a malfunction occurs. To prevent injuries and accidents, please be sure to observe the following items:

- The driving current and voltage should be used below the rated value.
- Please follow the terminal connection diagram for wiring. Especially for the reverse connection of the power supply, it will cause an accident due to circuit damage such as heat, smoke, fire, etc.
- In order to ensure safety, especially for important uses, please be sure to consider double safety circuit configuration.
- Do not apply pressure above the maximum applied pressure. In addition, please be careful not to mix foreign matter into the pressure medium. Otherwise, the sensor will be discarded, or the media will blow out and cause an accident.
- Be careful when fixing the product and connecting the pressure inlet. Otherwise, accidents may occur due to sensor scattering and the blowing out of the media.
- If the sensor come with sharp PIN, please be careful not to hurt your body when using it.
