

# 10A, Fully Integrated Synchronous Boost Converter

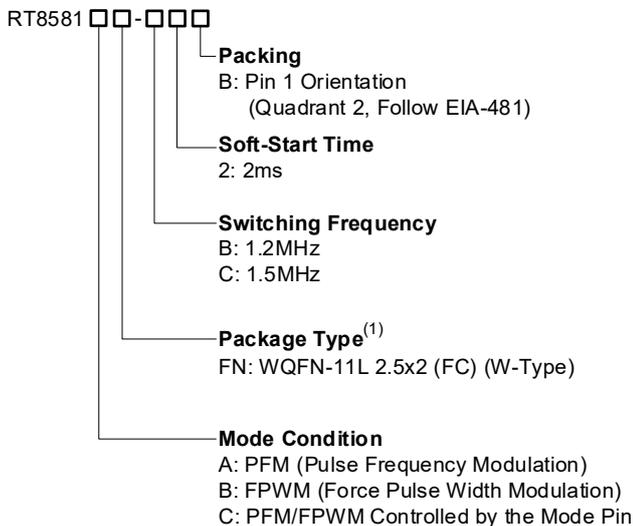

## 1 General Description

The RT8581 is a boost converter that integrates built-in power transistors, synchronous rectification, and low supply current to provide a compact solution for systems using advanced Li-Ion batteries. The RT8581 is capable of supplying significant energy when the battery voltage falls below the voltage required by system power ICs.

The RT8581 is designed to provide a minimum output voltage from a single-cell Li-Ion battery, even when the battery voltage is below the system's minimum voltage requirement.

The RT8581 is available in the WQFN-11L 2.5x2 (FC) package. The recommended junction temperature range spans from -40°C to 125°C, while the ambient temperature range extends from -40°C to 85°C.

## 2 Ordering Information

### Note 1.

Richtek products are Richtek Green Policy compliant and marked with <sup>(1)</sup> indicates compatible with the current requirements of IPC/JEDEC J-STD-020.

## 3 Features

- **Input Voltage Range: 2V to 12V**
- **Output Voltage Range: 4.5V to 12.6V**
- **Up to 94.5% Efficiency at  $V_{IN} = 5V$ ,  $V_{OUT} = 12V$ , and  $I_{OUT} = 1A$**
- **Soft-Start-Up Time (< 2msec)**
- **Adjustable Switching Frequency: 1.2MHz and 1.5MHz**
- **Adjustable Peak Current Limit: Up to 10A (Typical)**
- **PFM Operation Mode at Light Load (RT8581A)**
- **Forced PWM Operation Mode at Light Load (RT8581B)**
- **PFM/FPWM Controlled by the Mode Pin (RT8581C)**
- **Internal Synchronous Rectifier**
- **Overvoltage Protection at 13.2V**
- **Over-Temperature Protection**
- **WQFN-11L 2.5x2 (FC) Package**

## 4 Applications

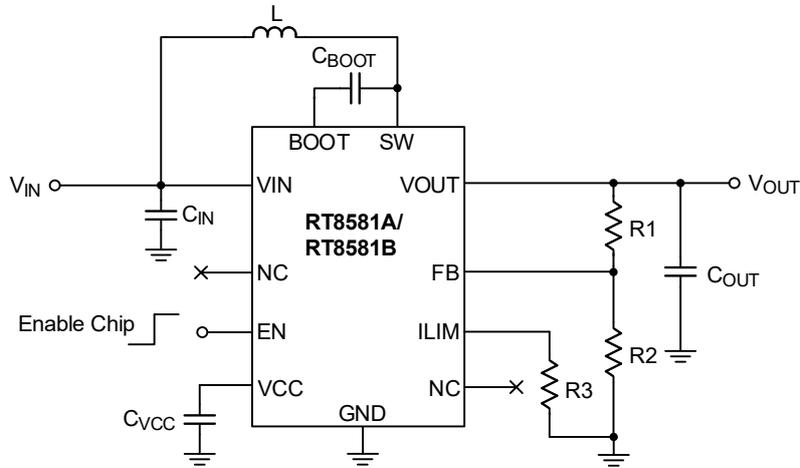

- RF PA Drivers
- NAND Flashes
- Backup Power
- Motor Drivers
- Optical Sensor Drivers
- Portable POS Terminals

## 5 Marking Information

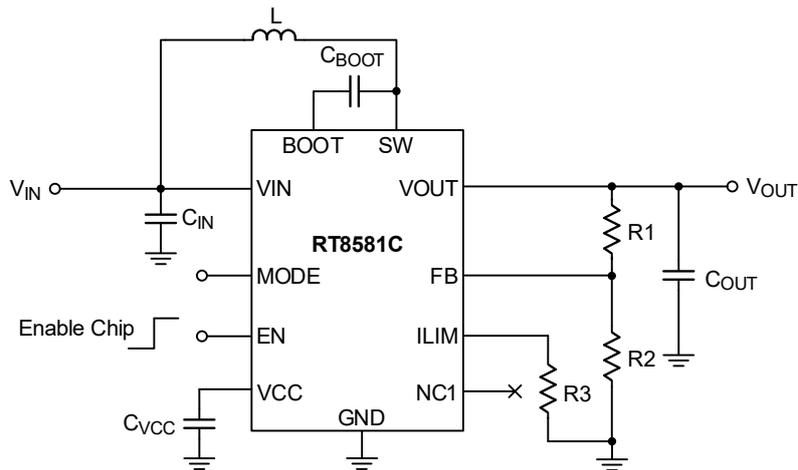

For marking information, contact our sales representative directly or through a Richtek distributor located in your area.

## 6 Simplified Application Circuit

7 Pin Configuration

(TOP VIEW)

RT8581A/RT8581B

RT8581C

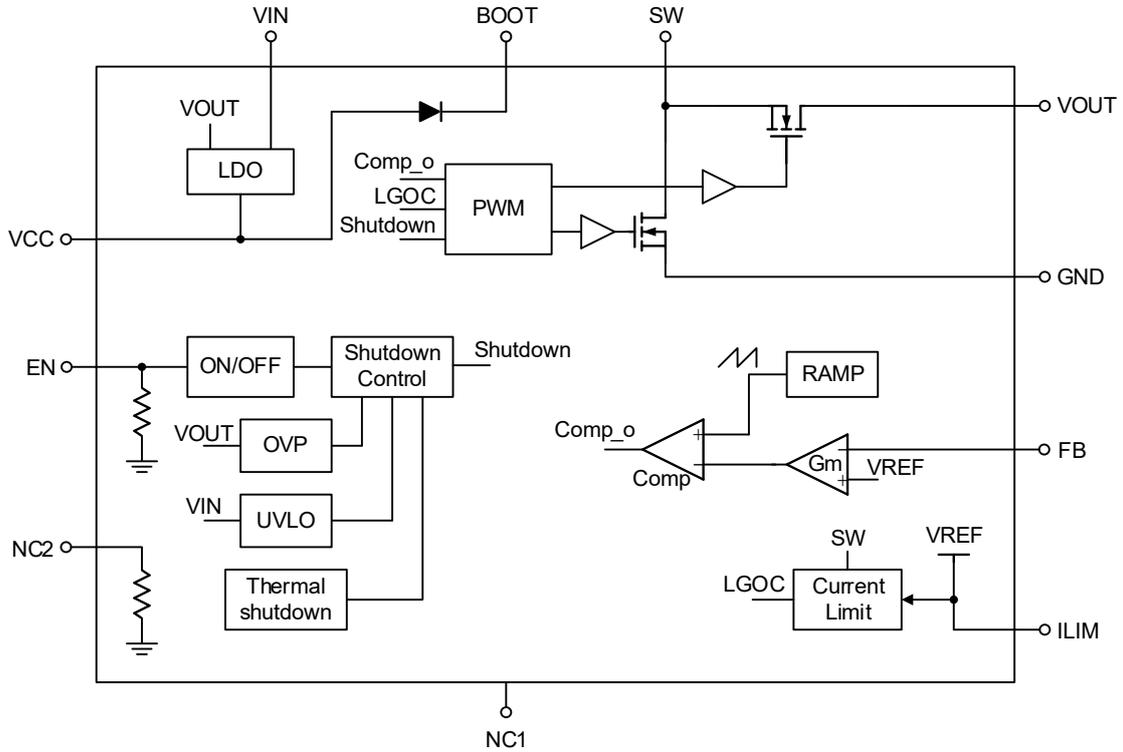

WQFN-11L 2x2.5 (FC)

8 Functional Pin Description

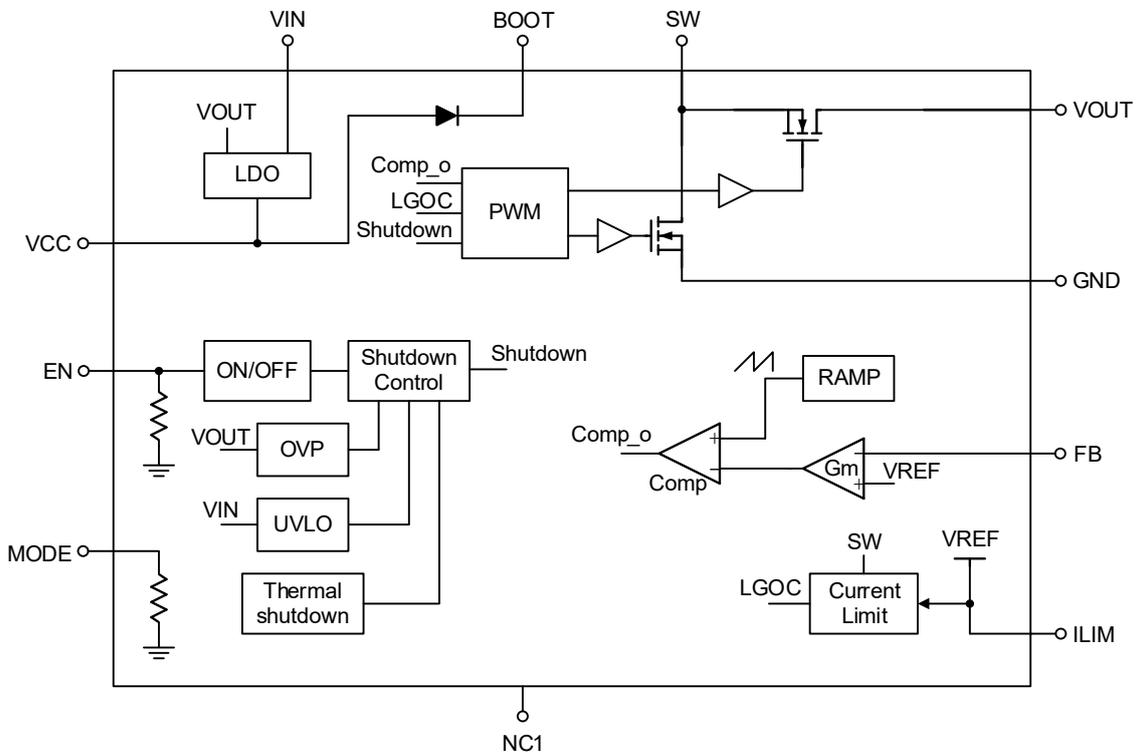

Pin No.		Pin Name	Pin Function
RT8581A/ RT8581B	RT8581C		
1	1	NC1	No internal connection.
2	2	VCC	Output of the internal regulator. A ceramic capacitor of more than 1μF is required between this pin and ground.
3	3	FB	Output voltage feedback. A resistor divider connecting to this pin sets the output voltage.
4	--	NC2	No internal connection.
--	4	MODE	This pin is used to control the converter to enter forced PWM (FPWM) mode. When this pin is set to HIGH, the circuit is in FPWM mode.
5	5	GND	Ground. This is power and signal ground reference for the chip. The COUT bypass capacitor should be returned with the shortest path possible to these pins.
6	6	VOUT	Output voltage. Place COUT as close as possible to the device.
7	7	EN	Enable. When this pin is set to HIGH, the circuit is enabled.
8	8	ILIM	Adjustable switching peak current limit. An external resistor should be connected between this pin and the GND pin.
9	9	VIN	Input voltage. This pin has to connect to input power, it is used to supply chip internal power.
10	10	BOOT	Power supply for high-side MOSFET gate driver. A capacitor must be connected between this pin and the SW pin.
11	11	SW	Switching node. The power inductor should be connected between SW and power input.

## 10 Absolute Maximum Ratings

(Note 2)

- VIN, SW, VOUT, NC1 ----- -0.3V to 14.5V
- EN, VCC, ILIM, FB, NC2 ----- -0.3V to 6V
- BOOT ----- -0.3V to SW+6V
- Power Dissipation,  $P_D @ T_A = 25^\circ\text{C}$   
 WQFN-11L 2.5x2 (FC) ----- 1.89W
- Package Thermal Resistance (Note 3)  
 WQFN-11L 2.5x2 (FC),  $\theta_{JA}$  ----- 52.92°C/W  
 WQFN-11L 2.5x2 (FC),  $\theta_{JC}$  ----- 4.74°C/W
- Lead Temperature (Soldering, 10 sec.) ----- 260°C
- Junction Temperature ----- -40°C to 150°C
- Storage Temperature Range ----- -65°C to 150°C
- ESD Susceptibility (Note 4)  
 HBM (Human Body Model) ----- ±2kV  
 CDM (Charged-Device Model) ----- ±500V

**Note 2.** Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

**Note 3.**  $\theta_{JA}$  is simulated under natural convection (still air) at  $T_A = 25^\circ\text{C}$  with the component mounted on a high effective-thermal-conductivity four-layer test board on a JEDEC 51-7 thermal measurement standard.  $\theta_{JC}$  is simulated at the bottom of the package.

**Note 4.** Devices are ESD sensitive. Handling precautions are recommended.

## 11 Recommended Operating Conditions

(Note 5)

- Input Voltage Range (Boost Mode) ----- 2V to  $V_{OUT(SET)} - 0.2\text{V}$
- Output Voltage Range ----- 4.5V to 12.6V
- Input Capacitor (Effective value),  $C_{IN(Min)}$  ----- 10µF
- Output Capacitor (Effective value),  $C_{OUT}$  ----- 10µF to 1000µF
- Inductance (Effective value), L  
 Switching Frequency (1.2MHz/1.5MHz) ----- 1µH to 4.7µH
- Ambient Temperature Range ----- -40°C to 85°C
- Junction Temperature Range ----- -40°C to 125°C

**Note 5.** The device is not guaranteed to function outside its operating conditions.

## 12 Electrical Characteristics

( $V_{IN} = 2.5V$  to  $5.5V$ ,  $V_{OUT} = 5V$  to  $12.6V$ ,  $C_{IN} = 10\mu F$ ,  $C_{OUT} = 66\mu F$ ,  $L1 = 4.7\mu H$ , Frequency =  $1.2MHz$ . All typical (Typ) limits apply for  $T_A = 25^\circ C$ , unless otherwise specified. All minimum (Min) and maximum (Max) apply over the full operating ambient temperature range ( $-40^\circ C \leq T_A \leq 125^\circ C$ ).

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit

## 15 Operation

### 15.1 Enable Function

The device can be enabled or disabled by the EN pin. When the EN pin is higher than the logic-high threshold, the device starts operating with soft-start. Once the EN pin is set at low, the device will shut down. In shutdown mode, the converter stops switching and consumes less than 5µA. Because of the body diode of the high-side MOSFET, the input voltage goes through the body diode and appears at the VOUT pin at shutdown mode.

### 15.2 Soft-Start Function

After the EN pin is pulled to a logic high voltage, the internal soft-start circuitry gradually ramps up the output voltage. This process helps to minimize inrush current during start-up. The typical soft-start time is 2ms (the timing is from 0V to V<sub>OUT(set)</sub>).

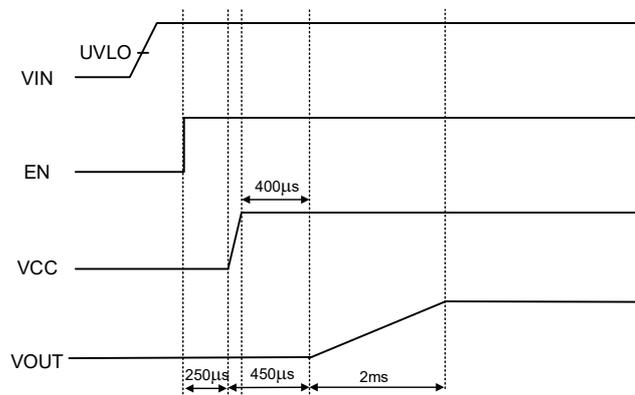

Figure 1. Soft-Start State

### 15.3 Adjustable Peak Current Limit

The RT8581 employs a cycle-by-cycle peak-current limit detection scheme to sense inductor current during the on-time. When the loading current exceeds the peak current-limit threshold, the on-time is reduced until the current falls back to the peak-current threshold. The on-time is determined by the (V<sub>OUT</sub> – V<sub>IN</sub>) / V<sub>OUT</sub> ratio. As the load current increases further, the output voltage decreases. The peak inductor current limit can be set by R<sub>LIM</sub>, and the current limit can be calculated using the following equation:

$$I_{LIM} = \frac{1030000}{R_{LIM}}$$

For a typical 8A current limit, the resistor value is 127kΩ for the RT8581.

### 15.4 Forced Pulse Width Modulation Mode

In order to avoid acoustic noise at light loads, the boost converter operates in FPWM (Forced Pulse Width Modulation) mode as the inductor current is in CCM (Continuous Current Mode) and the switching frequency is fixed. When the current through the MOSFET is zero, the high-side MOSFET is not turned off, and the on-time is determined by the (V<sub>O</sub>-V<sub>IN</sub>)/V<sub>O</sub> ratio of the switching period. In FPWM mode, the RT8581 can achieve lower output ripple compared to PFM mode. However, the efficiency will be lower under light load conditions.

### 15.5 Pulse Frequency Modulation Mode

To save power and enhance efficiency under light load conditions, the boost converter operates in PFM (Pulse Frequency Modulation) mode as the inductor current enters DCM (Discontinuous Current Mode). When the current through the MOSFET drops to zero, the high-side MOSFET is turned off until the next switching cycle. In PFM mode, the RT8581 extends the high-side MOSFET off-time during the switching period to deliver less energy to the output and regulate the output voltage.

## 16 Application Information

(Note 6)

### 16.1 Output Voltage Setting

The output voltage is adjustable via an external resistive divider. The resistive divider must be connected between  $V_{OUT}$ , FB, and GND. The output voltage can be calculated using the equation below:

$$R_1 = R_2 \times \left( \frac{V_{OUT}}{V_{FB}} - 1 \right)$$

### 16.2 Inductor Selection

The primary concern of inductor selection is the maximum loading of the application. An example is given based on the application conditions and equations below.

Application conditions:

$V_{IN} = 5V$ ,  $V_{OUT} = 12V$ ,  $I_{OUT} = 1.5A$ , converter efficiency = 86.25%, Frequency = 1.2MHz,  $L = 4.7\mu H$ .

Typical peak inductor current limit is 8A ( $R_{LIM} = 127k\Omega$ ).

Step 1: Calculate input current ( $I_{IN}$ ).

$$I_{IN} = \frac{V_{OUT} \times I_{OUT}}{V_{IN} \times \text{Eff}} = 4.174A$$

Step 2: Calculate the duty cycle of the boost converter.

$$D = 1 - \frac{V_{IN} \times \text{Eff}}{V_{OUT}} = 0.640$$

Step 3: Calculate the peak current of the inductor.

$$I_{L(\text{peak})} = I_{IN} + \frac{V_{IN} \times D}{2 \times L \times f_{sw}} = 4.458A$$

It is recommended to use an inductor with a DC saturation current  $\geq 4.5A$ .

### 16.3 Input Capacitor Selection

An input capacitor of at least  $10\mu F$  with a rated voltage of 6.3V for DC bias is recommended to improve the transient behavior of the regulator and EMI behavior of the total power supply circuit for SW. It is recommended to place the input capacitor as close as possible to the  $V_{IN}$  and GND pins of the IC.

### 16.4 Output Capacitor Selection

An output capacitor of at least  $10\mu F$  (effective value) is recommended to reduce  $V_{OUT}$  ripple.

The output voltage ripple is inversely proportional to  $C_{OUT}$ .

The output capacitor is selected based on the output ripple which is calculated as follows:

$$V_{\text{Ripple (p-p)}} = \frac{I_{OUT(\text{max})} \times D}{f_{sw} \times C_{OUT}}$$

therefore:

$$C_{OUT} = \left(1 - \frac{V_{IN} \times \text{Eff}}{V_{OUT}}\right) \times \frac{I_{OUT(max)}}{f_{SW} \times V_{Ripple (p-p)}}$$

The maximum  $V_{Ripple(p-p)}$  occurs at minimum input voltage and maximum output load.

### 16.5 Undervoltage-Lockout (UVLO)

The undervoltage-lockout circuit ensures proper operation of the RT8581 by preventing it from activating at low input voltages, which could lead to undefined behavior. This feature also safeguards the battery from deep discharge by inhibiting the power switches from turning on when the conditions are not ideal. For the converter to be enabled, the VIN voltage must exceed 1.9V. If the VIN voltage falls below 1.8V during operation, the converter is disabled. It then waits for the internal IC default parameters to reset until the supply voltage exceeds the UVLO rising threshold. The RT8581 automatically restarts if the input voltage recovers to the UVLO high level.

### 16.6 Over-Temperature Protection (OTP)

The device has a built-in temperature sensor which monitors the internal junction temperature. If the temperature exceeds the threshold, the device stops operating. As soon as the IC temperature decreases below the threshold with a hysteresis, it will resume operation. The built-in hysteresis is designed to avoid unstable operation at IC temperatures near the over-temperature threshold.

### 16.7 Thermal Considerations

The junction temperature should never exceed the absolute maximum junction temperature  $T_{J(MAX)}$ , listed under Absolute Maximum Ratings, to avoid permanent damage to the device. The maximum allowable power dissipation depends on the thermal resistance of the IC package, the PCB layout, the rate of surrounding airflow, and the difference between the junction and ambient temperatures. The maximum power dissipation can be calculated using the following formula:

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

where  $T_{J(MAX)}$  is the maximum junction temperature,  $T_A$  is the ambient temperature, and  $\theta_{JA}$  is the junction-to-ambient thermal resistance.

For continuous operation, the maximum operating junction temperature indicated under Recommended Operating Conditions is 125°C. The junction-to- ambient thermal resistance,  $\theta_{JA}$ , is highly package dependent. For a WQFN-11L 2.5x2 (FC) package, the thermal resistance,  $\theta_{JA}$ , is 52.92°C/W on a standard JEDEC 51-7 high effective-thermal-conductivity four-layer test board. The maximum power dissipation at  $T_A = 25^\circ\text{C}$  can be calculated as below:

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (52.92^\circ\text{C/W}) = 1.89\text{W for a WQFN-11L 2.5x2 (FC) package.}$$

The maximum power dissipation depends on the operating ambient temperature for the fixed  $T_{J(MAX)}$  and the thermal resistance,  $\theta_{JA}$ . The derating curve in [Figure 2](#) allows the designer to see the effect of rising ambient temperature on the maximum power dissipation.

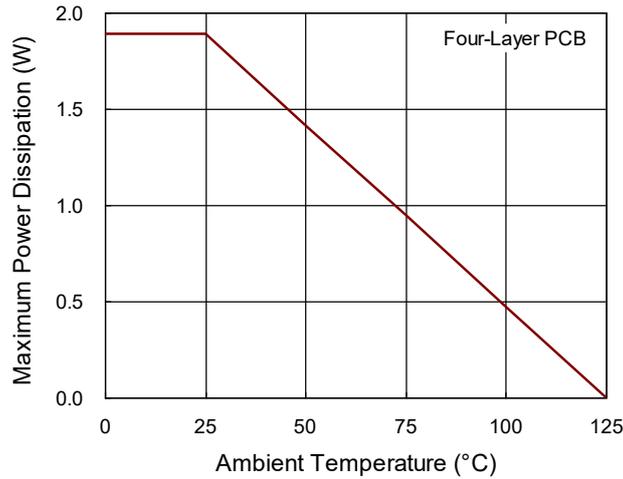

Figure 2. Derating Curve of Maximum Power Dissipation

**16.8 Layout Considerations**

The PCB layout is a critical factor in preserving the high performance of the RT8581.

Special attention must be given to the high current paths and the fast-switching nodes to ensure the robustness of the RT8581. An improper layout can lead to poor line or load regulation, shifts in ground and output voltage, stability issues, unsatisfactory EMI behavior, and worsened efficiency. To achieve the best performance of the RT8581, the following PCB layout guidelines must be strictly followed.

- Place the input and output capacitors as close as possible to the input and output pins to ensure effective filtering.
- For thermal consideration, it is necessary to maximize the pure area for the power stage area besides the SW pin.

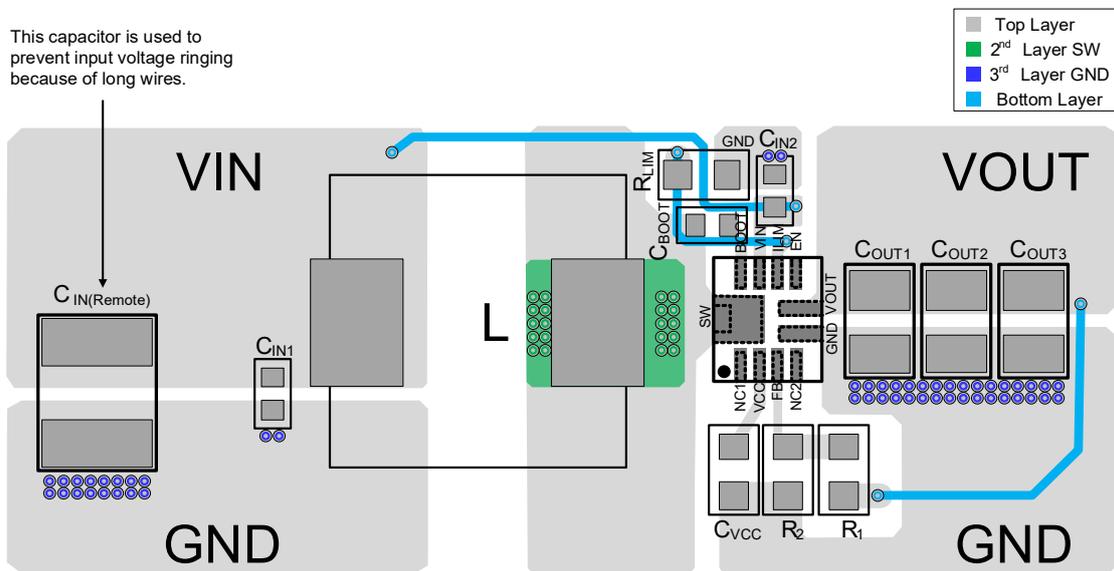

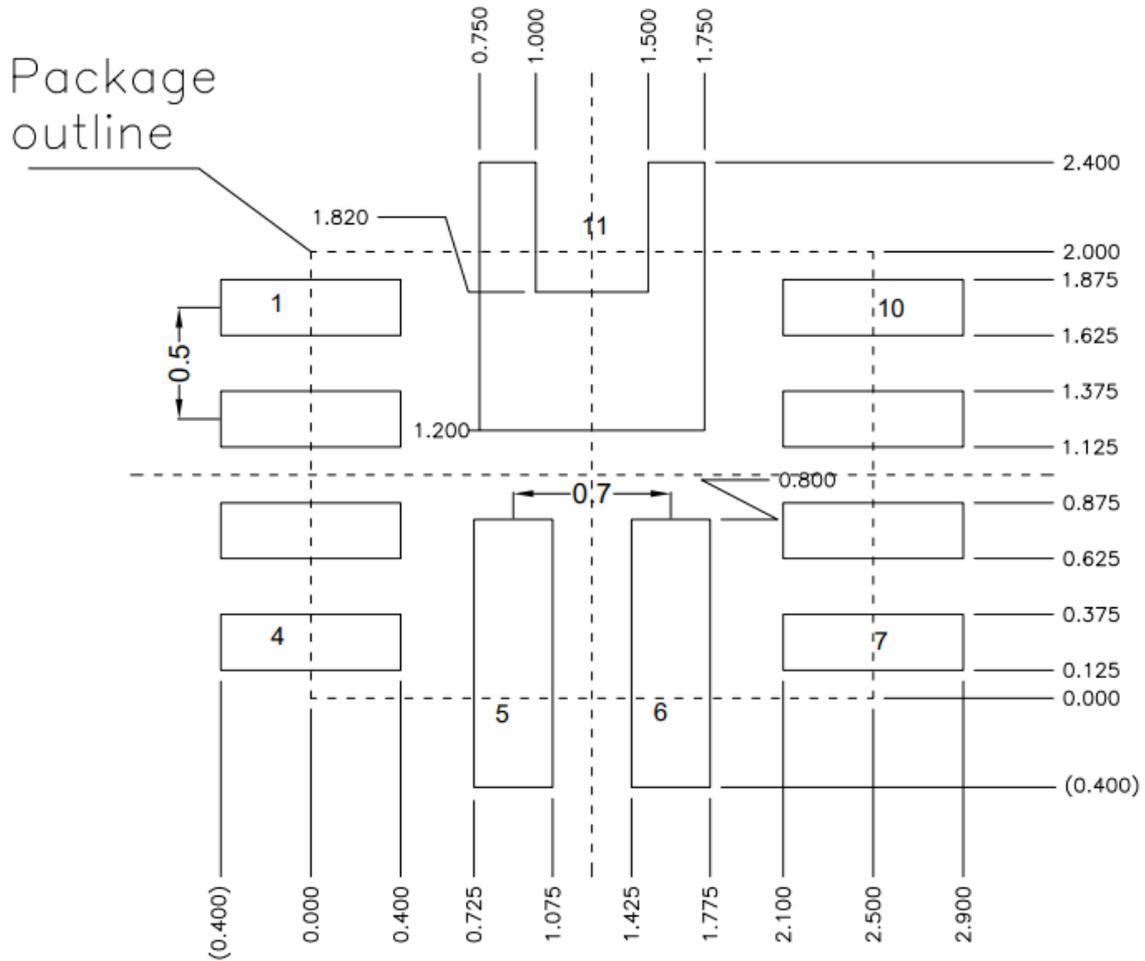

Figure 3. PCB Layout Guide
