

NN514105A series EDO (Hyper Page) Mode CMOS 4M × 1bit Dynamic RAM

NPNX

DESCRIPTION

The NN514105A series is a high performance CMOS Dynamic Random Access Memory organized as 4,194,304 words by 1-bits. The NN514105A series is fabricated with advanced CMOS technology and designed with innovative design techniques resulting in high speed, extremely low power and wide operating margins at both component and system levels.

The NN514105A series features an EDO (Hyper page) mode operation in which a high speed read, write or read-write is performed on any column address along a row address.

An extremely short row address capture time and an asynchronous column address decoder relax the timing constraints associated with address multiplexing.

Refresh is accomplished by performing $\overline{\text{RAS}}$ only refresh cycles, hidden refresh cycles, $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh cycles, or normal read or write cycles on the 1,024 address combinations of A0 to A10 during a 16 ms period.

Multiplexed address inputs permit The NN514105A series to be packaged in a standard 26-pin plastic SOJ, 26 pin TSOP TYPE II. The package sizes provide high system bit densities and are compatible with widely available automated testing and insertion equipment. System level features include single power supply of 5V $\pm$ 10% tolerance and direct interface with high performance TTL logic families.

FEATURES

- 4,194,304 × 1 bit Organization
- Single 5V $\pm$ 10% Power Supply
- Performance Ranges

Parameter	-45	-50	-60	-70
Max. $\overline{\text{RAS}}$ Access Time (t_{RAC})	45ns	50ns	60ns	70ns
Max. $\overline{\text{CAS}}$ Access Time (t_{CAC})	13ns	13ns	15ns	20ns
Max. Column Address Access Time (t_{AA})	23ns	25ns	30ns	35ns
Min. Read/Write Cycle Time (t_{RC})	80ns	90ns	110ns	130ns

- EDO (Hyper Page) Mode Operation
- Low Power Operation
Low Standby Current (CMOS level inputs)
 - Standard 1mA
 - L version 50 μ A
- 1,024 Refresh Cycles
 - Standard distributed across 16ms
 - L version distributed across 128ms
- Self Refresh Mode (L version)
- All inputs/Outputs and Clocks fully TTL and CMOS compatible
- Refresh Modes
 - $\overline{\text{RAS}}$ only
 - $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$
 - Hidden Refresh
- ×8 bit Test Mode
- High Reliability Packages
 - Plastic 26pin SOJ (P26/20SJ-2A)
 - Plastic 26pin TSOP TYPE II (P26/20TP-2A/R)

ABSOLUTE MAXIMUM RATINGS

RATING	SYMBOL	VALUE	UNIT
Voltage on Any Pin Relative to V _{SS}	V _{in} , V _{out}	-1 to 7	V
Voltage on V _{CC} Relative to V _{SS}	V _{CC}	-1 to 7	V

Permanent device damage can occur if absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods can affect device reliability.

Notes:

3. Eight Initialization Cycles are required following a 200 μ s pause after Power Up. These Initialization Cycles may consist of any combination of the following : RAS only refresh Cycles, Read Cycles, Write Cycles. CAS before $\overline{\text{RAS}}$ refresh Cycles.
4. AC measurements assume $t_1=3\text{ns}$. All AC parameters are measured with $V_{\text{IL}}(\text{min.}) \geq V_{\text{SS}}$ and $V_{\text{IH}}(\text{max.}) \leq V_{\text{CC}}$ and with a load equivalent to two TTL loads and 100pF.
5. $V_{\text{IH}}(\text{min.})$ and $V_{\text{IL}}(\text{max.})$ are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} and V_{IL} .
6. Operation within the $t_{\text{RCD}}(\text{max.})$ limit ensures that $t_{\text{RAC}}(\text{max.})$ can be met. $t_{\text{RCD}}(\text{max.})$ is specified as a reference point only. If t_{RCD} is greater than the specified $t_{\text{RCD}}(\text{max.})$ limit, then access time is controlled by t_{CAC} .
7. Operation within the $t_{\text{RAD}}(\text{max.})$ limit ensures that $t_{\text{RAC}}(\text{max.})$ can be met. $t_{\text{RAD}}(\text{max.})$ is specified as a reference point only. If t_{RAD} is greater than the specified $t_{\text{RAD}}(\text{max.})$ limit, then access time is controlled by t_{AA} .
8. Assumes three state test load (5pF and a 220 ohm to 1.3V Thevenin equivalent).
9. Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.
10. $t_{\text{OFF}}(\text{max.})$ defines the time at which the output achieves an open circuit condition and is not referenced to output voltage levels. t_{OFF} only applies when $\overline{\text{RAS}}$ is high.
11. t_{WCS} , t_{RWD} , t_{CWD} and t_{AWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $t_{\text{WCS}} \geq t_{\text{WCS}}(\text{min.})$, the cycle is an early write cycle and data-out pins will remain open circuit (high impedance) throughout the entire cycle. If $t_{\text{RWD}} \geq t_{\text{RWD}}(\text{min.})$, $t_{\text{CWD}} \geq t_{\text{CWD}}(\text{min.})$ and $t_{\text{AWD}} \geq t_{\text{AWD}}(\text{min.})$, the cycle is a read-modify-write cycle and the data-out will contain data read from the selected cell. If neither of the above conditions is satisfied, the condition of the data-out (at access time) is indeterminate.
12. These parameters are referenced to $\overline{\text{CAS}}$ leading edge in early write cycles and to $\overline{\text{WE}}$ leading edge in read-modify-write cycles.
13. Access time is determined by the longer of t_{AA} , t_{CAC} , or t_{CPA} .
14. $t_{\text{ASC}} \geq t_{\text{CP}}$ to achieve $t_{\text{PC}}(\text{min.})$ and $t_{\text{CPA}}(\text{max.})$ values.
15. $t_{\text{REF}}=128\text{msec}$ for Long Refresh version (L version).
16. t_{OFR} applies only when CAS is high.

Note: A0-A10 = Don't care.

$\overline{\text{WE}}$ must be high at the falling edge of $\overline{\text{RAS}}$ in order to prevent from entering test mode.

HIDDEN REFRESH CYCLE (READ)

HIDDEN REFRESH CYCLE (EARLY WRITE)

TEST MODE SET CYCLE ($\overline{WE}$, $\overline{CAS}$ BEFORE $\overline{RAS}$ REFRESH CYCLE)

■ The NN514105A has an 8 bit parallel Test Mode Function for reducing test time. In the Test Mode, memory configuration is 512K x 8 bits and the Column address A0 is ignored.

a. Entering the test mode:

The NN514105A test mode is entered by using the test mode set cycle ($\overline{WE}$, $\overline{CAS}$ before $\overline{RAS}$ cycle).

b. Read/Write operation in test mode:

For Write cycle, data input from Din is written to 8 parallel memory cells at the same time.

During the read cycle, if all read data is equivalent then a "1" is output from Dout.

If even one bit is not equal then a "0" will be output from Dout.

c. Exiting the test mode:

The NN514105A will exit the test mode by either a $\overline{RAS}$ only refresh cycle or a $\overline{CAS}$ before $\overline{RAS}$ refresh cycle with $\overline{WE}$ "high".

d. Refresh during test mode:

During test mode refresh must be executed by a normal Read cycle or a $\overline{WE}$, $\overline{CAS}$ before $\overline{RAS}$ refresh cycle.

SELF REFRESH MODE

■ The NN514105AL version has a Self Refresh Mode.

a. Entering the Self Refresh Mode:

The NN514105AL Self Refresh Mode is entered by using $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ cycle with $\overline{\text{WE}}$ "high" and holding $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ signal "low" longer than 300 μs .

b. Continuing the Self Refresh Mode:

The Self Refresh Mode is continued by holding $\overline{\text{RAS}}$ "low" after entering the Self Refresh Mode. It does not depend on $\overline{\text{CAS}}$ being "high" or "low" after entering the Self Refresh Mode for to continue the Self Refresh Mode.

c. Exiting the Self Refresh Mode:

The NN514105AL exits the Self Refresh Mode when the $\overline{\text{RAS}}$ signal is brought "high".
