Adder/Subtractor

Dual 2-Bit Adder/Subtractor

FEATURES

- Typical propagation delay: A_n, B_n to C_{OUT} 4.5ns
- Typical supply current ($-I_{EE}$): 70mA

DESCRIPTION

The 10180 is a high-speed, low power, general purpose adder/subtractor. Inputs for each adder are: Carry-in (C_{0IN}, C_{1IN}), Operand A (A_0, A_1), Operand B (B_0, B_1). Outputs are Sum (F_0, F_1), Σ (F_0, F_1) and Carry-out (C_{0OUT}, C_{1OUT}). Common select inputs act as controlled lines to invert A or B for subtraction. A very high-speed operation is possible with Operand in the Sum or Carryout propagation delay of 4.5ns, and Carry-in to Carry-out propagation delay of 2.2ns. The 10180 is designed to be used in special purpose adder/subtractor or in high-speed multiplier arrays.

All unused inputs can be left open due to integrated pull-down resistors which avoid the need for a supply voltage.

NOTES:

1. The specified limits represent the worst case values for the parameter. Since these worst case values normally occur at the supply voltage and temperature extremes, additional noise immunity can be achieved by decreasing the allowable operating condition ranges.
2. Conditions for testing shown in the tables are not necessarily worst case. For worst case testing guidelines, refer to DC Testing, Chapter 1, Section 3.
3. The specified limits shown in the DC Electrical Characteristics table can be met only after thermal equilibrium has been established. Thermal equilibrium is established by applying power for at least 2 minutes, while maintaining transverse airflow of 2.5 meters/sec (500 linear feet/min) over the device, mounted either in a test socket or on a printed circuit board. Test voltage values are given in the DC Operating Conditions table.
