

January 1994

DESCRIPTION

The SSI 32R1203A is a bipolar monolithic integrated circuit designed for use with center-tapped ferrite or MIG recording heads. It provides a low noise read path with a gain of 250 V/V, write current control, and data protection circuitry for as many as 4 channels. Power supply fault protection is provided by disabling the write current generator during power sequencing. A Power Down mode (Idle) is provided to reduce power consumption to less than 10 mW.

The SSI 32R1203A requires only a +5V power supply and is available in a surface mount package.

FEATURES

- +5V only power supply
- Low power
 - $P_d \leq 225$ mW Read mode
 - $P_d \leq 10$ mW Idle mode
- High Performance
 - Input noise = 1.2 nV/ $\sqrt{\text{Hz}}$ max.
 - Input capacitance = 19 pF max.
 - Write current range = 15 - 50 mA
 - Head voltage swing = 6.0 Vpk
- 250 V/V read gain
- Designed for center-tapped ferrite or MIG heads
- Power supply fault protection
- Includes write unsafe detection
- Enhanced Write to Read recovery

FUNCTIONAL DESCRIPTION

WRITE MODE

A source of recording current is provided to the head center tap by an internal voltage reference, VCT. The current is conducted through the head alternately into an HnX terminal or an HnY terminal according to the state of an internal flip-flop. The flip-flop is triggered by the negative transition of the Write Data Input line (WDI). A preceding Read mode selection initializes the write data flip-flop, WDFF, to pass write current through the "X" side of the head. The write current magnitude is determined by the value of an external resistor Rwc connected between WC terminal and GND, and is given by:

$I_w = K/R_{wc}$, where K = Write Current Constant

WRITE MODE FAULT DETECT CIRCUIT

Several circuits are dedicated to detecting fault conditions associated with the Write mode. A logical high level will be present at the Write Unsafe (WUS) terminal if any of the following write fault conditions are present:

- Head open
- Head center tap open
- Head shorted
- Head shorted to ground
- No write current
- WDI frequency too low
- Device in Read or Idle mode

The Write Unsafe output is open-collector and is usually terminated by an external resistor connected to VCC. Two negative transitions on WDI, after the fault is corrected, will clear the WUS flag.

A safe condition, WUS low, requires alternating voltage spikes on both HnX and HnY that exceed $V_{CT} + 1.5V$ at a rate equal to or higher than the Minimum Rate of WDI for Safe condition.

In addition, the power supply voltage level is monitored by a circuit that inhibits the write current if VCC is too low to permit valid data recording.

READ MODE

In Read Mode, ($R/\bar{W}$ high and $\bar{CS}$ low), the circuit functions as a low noise gain selectable differential amplifier. The read amplifier input terminals are determined by the Head Select inputs. The read amplifier outputs (RDX, RDY) are emitter follower sources, providing low impedance outputs. The amplifier polarity is non-inverting between HnX, HnY inputs and RDX, RDY outputs.

IDLE MODE

Taking $\bar{CS}$ high selects the Idle mode which switches the RDX and RDY outputs into a high impedance state and deactivates the device. Power consumption in this mode is held to a minimum.

MODE SELECTION AND INDICATION CIRCUIT

Logical control inputs which select mode and head channel are TTL compatible. Their functions are described in Table 1 and Table 2.

TABLE 1: Head Select Table

Head Selected	HS1	HS0
0	0	0
1	0	1
2	1	0
3	1	1

TABLE 2: Mode Select Table

Mode Select		Selected Mode	Indicating & Fault Outputs
$\bar{CS}$	R/ $\bar{W}$		WUS
1	X	Idle	high
0	1	Read	high
0	0	Write	active

PIN DESCRIPTION

NAME	TYPE	DESCRIPTION
HS0, HS1	I*	Head Select: Logical combinations select one of four Heads. See Table 1
$\overline{CS}$	I	Chip Select: a low level enables device. Has internal pull-up resistor.
R/W	I*	Read/Write: a high level selects Read mode. Has internal pull-up resistor.
WUS	O*	Write Unsafe: a high level indicates an unsafe writing condition.
WDI	I*	Write Data In: negative transition toggles direction of head current.
H0X-H3X H0Y-H3Y	I/O	X, Y head connections
RDX, RDY	O*	X, Y Read Data: differential read signal output.
WC	-	Write Current: used to set the magnitude of the write current.
VCT	-	Voltage Center Tap: voltage source for head center tap.
VCC	-	+5V
GND	-	Ground

* When more than one R/W device is used, these signals can be wire OR'ed with unselected R/W devices.

ELECTRICAL SPECIFICATIONS

ABSOLUTE MAXIMUM RATINGS

All voltages referenced to GND. Currents into device are positive.

PARAMETER		RATING
DC Supply Voltage	VCC	-0.3 to +6 VDC
Digital Input Voltage Range HS1, HS0, WDI, R/W, $\overline{CS}$		-0.3 to (VCC + 0.3 VDC)
Head Port Voltage Range	VH	-0.3 to (VCC + 3.0 VDC)
Write Current Pin Voltage	Vwc	-0.3 to (VCC + 0.3 VDC)
WUS Pin Voltage Range	Vwus	-0.3 to +6.0 VDC
Write Current Zero-Peak	IW	60 mA
RDX, RDY Output Current	Io	-10 mA
RDX, RDY Pin Voltage		VCC + 0.3 VDC
VCT Output Current Range	Ivct	-60 mA to +10 mA
WUS Output Current Range	Iwus	-0.1 mA to +10 mA
Storage Temperature Range	Tstg	-65 to 150°C
Package Temperature (20 sec Reflow)		215°C
