

**Low EMI Spread Spectrum Multiplier Clock**

**FEATURES**

- Spread Spectrum Clock Generator with selectable multiplier from 1x to 4x outputs.
- Output frequency ranges: 24MHz to 240MHz.
- Selectable Down Spread Modulation.
- TTL/CMOS compatible outputs.
- 3.3V Operating Voltage.
- Low short term jitter.
- Available in 8-Pin 150mil SOIC.

**PIN CONFIGURATION**

FIN = 24 ~ 120 Mhz

Note: v: 30kΩ Internal Pull down ^: 30kΩ Internal Pull up.

**DESCRIPTIONS**

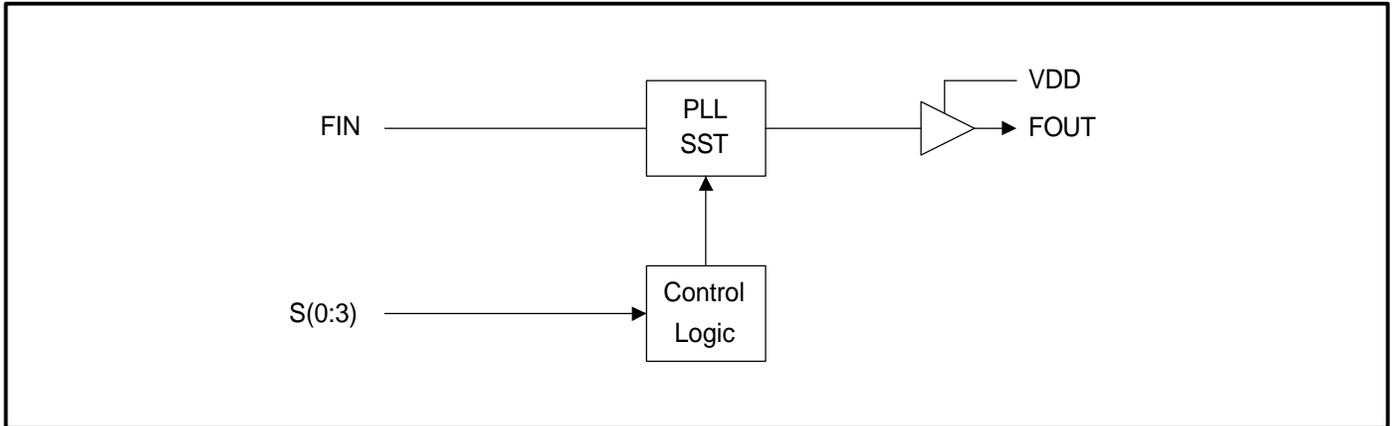

The PLL701-13 is a Spread Spectrum Clock Generator designed for the purpose of reducing EMI in high-speed digital systems. The selectable Down Spread modulation amplitude (see table below) permits EMI reduction without over-clocking the output. Any output frequency can be selected by programming 4 multiplier modes. The device operates over a very wide range of input frequencies and provides 1x to 4x modulated clock outputs.

Storage Temperature	$T_S$	-65	150	°C
Ambient Operating Temperature*	$T_A$	-40	85	°C

Exposure of the device under conditions beyond the limits specified by Maximum Ratings for extended periods may cause permanent damage to the device and affect product reliability. These conditions represent a stress rating only, and functional operations of the device at these or any other conditions above the operational limits noted in this specification is not implied.

\* **Note:** Operating Temperature is guaranteed by design for all parts (COMMERCIAL and INDUSTRIAL), but tested for INDUSTRIAL grade only.

### FUNCTIONAL DESCRIPTION

#### Selectable spread spectrum and modulation rates

The PLL701-13 provides selectable spread spectrum modulation, as well as selectable modulation rate. Selection is made by connecting specific pins to a logical "zero" or "one", according to the output clock selection table and modulation rate selection table on page 1.

Pins 2 (S2), 3 (S1), 4 (S0), and 7 (S3) are used as inputs to select the spread spectrum modulation as shown on the output clock selection table (page 1).

#### Default values for S(0:3) through internal pull-up and pull-down resistor

Selection pins S0 and S3 have an internal pull-down resistor of 30k $\Omega$ , pins 2 and 3 (S1 and S2) have an internal pull-up resistor of 30k $\Omega$ . This internal pull-up (or pull-down) resistor will pull the input value to a logical "one" (or "zero" respectively) by default, i.e. when no resistive load is connected between the pin and GND (VDD respectively). In order to override the internal pull-up (pull-down), the pin has to be connected to GND (VDD respectively).
