To all our customers

Regarding the change of names mentioned in the document, such as Mitsubishi Electric and Mitsubishi XX, to Renesas Technology Corp.

The semiconductor operations of Hitachi and Mitsubishi Electric were transferred to Renesas Technology Corporation on April 1st 2003. These operations include microcomputer, logic, analog and discrete devices, and memory chips other than DRAMs (flash memory, SRAMs etc.) Accordingly, although Mitsubishi Electric, Mitsubishi Electric Corporation, Mitsubishi Semiconductors, and other Mitsubishi brand names are mentioned in the document, these names have in fact all been changed to Renesas Technology Corp. Thank you for your understanding. Except for our corporate trademark, logo and corporate statement, no changes whatsoever have been made to the contents of the document, and these changes do not constitute any alteration to the contents of the document itself.

Note : Mitsubishi Electric will continue the business operations of high frequency & optical devices and power devices.

M5M5W816TP - 55HI, 70HI, 85HI

MITSUBISHI LSIs

8388608-BIT (524288-WORD BY 16-BIT) CMOS STATIC RAM

DESCRIPTION

The M5M5W816TP is a family of low voltage 8-Mbit static RAMs organized as 524288-words by 16-bit, fabricated by Mitsubishi's high-performance 0.18µm CMOS technology.

The M5M5W816TP is suitable for memory applications where a simple interfacing, battery operating and battery backup are the important design objectives.

The M5M5W816TP is packaged in a 44pin thin small outline mount device, with the outline of 400mil TSOP TYPE(II). It gives the best solution for a compaction of mounting area as well as flexibility of wiring pattern of printed circuit boards.

FEATURES

- Single 2.7~3.6V power supply
- Small stand-by current: 0.1µA (2.0V, typ.)
- No clocks, No refresh
- Data retention supply voltage =2.0V
- All inputs and outputs are TTL compatible.
- Easy memory expansion by S#, BC1# and BC2#
- Common Data I/O
- Three-state outputs: OR-tie capability
- OE# prevents data contention in the I/O bus
- Process technology: 0.18µm CMOS
- Package: 44pin 400mil TSOP TYPE(II)

FUNCTION

The M5M5W816TP is organized as 524288-words by 16-bit. These devices operate on a single +2.7~3.6V power supply, and are directly TTL compatible to both input and output. Its fully static circuit needs no clocks and no refresh, and makes it useful.

The operation mode are determined by a combination of the device control inputs BC1# , BC2# , S# , W# and OE#. Each mode is summarized in the function table.

A write operation is executed whenever the low level W# overlaps with the low level BC1# and/or BC2# and the low level S#. The address(A0~A18) must be set up before the write cycle and must be stable during the entire cycle.

A read operation is executed by setting W# at a high level and OE# at a low level while BC1# and/or BC2# and S# are in an active state(S#=L).

When setting BC1# at the high level and other pins are in an active stage , upper-byte are in a selectable mode in which both reading and writing are enabled, and lower-byte are in a non-selectable mode. And when setting BC2# at a high level and other pins are in an active stage, lower-byte are in a selectable mode and upper-byte are in a non-selectable mode.

When setting BC1# and BC2# at a high level or S# at a high level, the chips are in a non-selectable mode in which both reading and writing are disabled. In this mode, the output stage is in a high-impedance state, allowing OR-tie with other chips and memory expansion by BC1#, BC2# and S#.

The power supply current is reduced as low as 0.1µA(25°C, typical), and the memory data can be held at +2.0V power supply, enabling battery back-up operation during power failure or power-down operation in the non-selected mode.
