## 1Mx36 & 2Mx18 QDR™ II+ b4 SRAM

### 1Mx36-bit, 2Mx18-bit QDR™ II+ b4 SRAM

#### FEATURES

- 1.8V+0.1V/-0.1V Power Supply.
- DLL circuitry for wide output data valid window and future frequency scaling.
- I/O Supply Voltage 1.5V+0.1V/-0.1V
- Separate independent read and write data ports with concurrent read and write operation
- HSTL I/O
- Full data coherency, providing most current data .
- Synchronous pipeline read with self timed late write.
- Read latency: 2.5 clock cycles
- Registered address, control and data input/output.
- DDR(Double Data Rate) Interface on read and write ports.
- Fixed 4-bit burst for both read and write operation.
- Clock-stop supports to reduce current.
- Two input clocks(K and  $\bar{K}$ ) for accurate DDR timing at clock rising edges only.
- Two echo clocks (CQ and  $\bar{CQ}$ ) to enhance output data traceability.
- Data Valid pin(QVLD) supported
- Single address bus.
- Byte write (x18, x36) function.
- Separate read/write control pin( $\bar{R}$  and  $\bar{W}$ )
- Simple depth expansion with no data contention.
- Programmable output impedance(ZQ).
- JTAG 1149.1 compatible test access port.
- 165FBGA(11x15 ball array) with body size of 15mmx17mm.

Organization	Part Number	Cycle Time	Access Time	Unit
X36	K7S3236U4C-F(E)C(I)45	2.22	0.45	ns
	K7S3236U4C-F(E)C(I)40	2.5	0.45	ns
	K7S3236U4C-F(E)C(I)33	3.0	0.45	ns
X18	K7S3236U4C-F(E)C(I)45	2.22	0.45	ns
	K7S3218U4C-F(E)C(I)40	2.5	0.45	ns
	K7S3218U4C-F(E)C(I)33	3.0	0.45	ns

\* -F(E)C(I)

F(E) [Package type] : E-Pb Free, F-Pb

C(I) [Operating Temperature] : C-Commercial, I-Industrial

#### FUNCTIONAL BLOCK DIAGRAM

ELECTRONICS

**GENERAL DESCRIPTION**

The K7S3236T4C and K7S3218T4C are 37,748,736-bit QDR (Quad Data Rate) Synchronous Pipelined Burst SRAMs. They are organized as 1,048,576 words by 36 bits for K7S3236T4C and 2,097,152 words by 18 bits for K7S3218T4C.

The QDR operation is possible by supporting DDR read and write operations through separate data output and input ports with the same cycle. Memory bandwidth is maximized as data can be transferred into and out of SRAM on every rising edge of  $\overline{K}$  and  $\overline{K}$ . And totally independent read and write ports eliminate the need for high speed bus turn around.

Address for read and write are latched on alternate rising edges of the input clock K. Data inputs, data output, and all control signals are synchronized to the input clock ( $K$  or  $\overline{K}$ ). Read data are referenced to echo clock ( $CQ$  or  $\overline{CQ}$ ) outputs. Common address bus is used to access address both for read and write operations. The internal burst counter is fixed to 4-bit sequential for both read and write operations, requiring two full clock bus cycles. Any request that attempts to interrupt a burst operation in progress is ignored. Synchronous pipeline read and late write enable high speed operations. Simple depth expansion is accomplished by using  $\overline{R}$  and  $\overline{W}$  for port selection. Byte write operation is supported with  $\overline{BW}_0$  and  $\overline{BW}_1$  ( $\overline{BW}_2$  and  $\overline{BW}_3$ ) pins.

IEEE 1149.1 serial boundary scan (JTAG) simplifies monitoring package pads attachment status with system.

The K7S3236T4C and K7S3218T4C are implemented with SAMSUNG's high performance 6T CMOS technology and is available in 165pin FBGA packages. Multiple power and ground pins minimize ground bounce.

**Read Operations**

Read cycles are initiated by activating  $\overline{R}$  at the rising edge of the positive input clock K. Address is presented and stored in the read address register synchronized with K clock. For 4-bit burst DDR operation, it will access four 36-bit or 18-bit data words with each read command.

The first pipelined data is transferred out of the device triggered by K clock rising edge. Next burst data is triggered by the rising edge of following  $\overline{K}$  clock rising edge. The process continues until all four data are transferred. Continuous read operations are initiated with K clock rising edge. And pipelined data are transferred out of device on every rising edge of both K and  $\overline{K}$  clocks. Initial read data latency is 2.5 clock cycles when DLL is on.

When the  $\overline{R}$  is disabled after a read operation, the K7S3236T4C and K7S3218T4C will first complete burst read operation before entering into deselect mode at the next K clock rising edge. Then output drivers disabled automatically to high impedance state.

**Write Operations**

Write cycles are initiated by activating  $\overline{W}$  at the rising edge of the positive input clock K. Address is presented and stored in the write address register synchronized with K clock. For 4-bit burst DDR operation, it will write four 36-bit or 18-bit data words with each write command.

The first "late" data is transferred and registered in to the device synchronous with next K clock rising edge. Next burst data is transferred and registered synchronous with following  $\overline{K}$  clock rising edge. The process continues until all four data are transferred and registered. Continuous write operations are initiated with K rising edge. And "late written" data is presented to the device on every rising edge of both K and  $\overline{K}$  clocks.

The device disregards input data presented on the same cycle  $\overline{W}$  disabled. When the  $\overline{W}$  is disabled after a write operation, the K7S3236T4C and K7S3218T4C will first complete burst write operation before entering into deselect mode at the next K clock rising edge.

The K7S3236T4C and K7S3218T4C support byte write operations. With activating  $\overline{BW}_0$  or  $\overline{BW}_1$  ( $\overline{BW}_2$  or  $\overline{BW}_3$ ) in write cycle, only one byte of input data is presented. In K7S3218T4C,  $\overline{BW}_0$  controls write operation to D0:D8,  $\overline{BW}_1$  controls write operation to D9:D17. And in K7S3236T4C,  $\overline{BW}_2$  controls write operation to D18:D26,  $\overline{BW}_3$  controls write operation to D27:D35.

### **Depth Expansion**

Separate input and output ports enables easy depth expansion. Each port can be selected and deselected independently and read and write operation do not affect each other. Before chip deselected, all read and write pending operations are completed.

### **Programmable Impedance Output Buffer Operation**

The designer can program the SRAM's output buffer impedance by terminating the ZQ pin to Vss through a precision resistor(RQ). The allowable range of RQ is between 175Ω and 350Ω. The value of RQ (within 15% tolerance) is five times the output impedance desired. For example, 250Ω resistor will give an output impedance of 50Ω.

Impedance updates occur early in cycles that do not activate the outputs, such as deselect cycles. In all cases impedance updates are transparent to the user and do not produce access time "push-outs" or other anomalous behavior in the SRAM. To guarantee optimum output driver impedance after power up, the SRAM needs 1024 non-read cycles.

### **Output Valid Pin (QVLD)**

The Q Valid indicates valid output data. QVLD is activated half cycle before the read data for the receiver to be ready for capturing the data. QVLD is edge aligned with CQ and  $\overline{CQ}$ .

### **Echo clock operation**

To assure the output traceability, the SRAM provides the output Echo clock, pair of compliment clock CQ and  $\overline{CQ}$ , which are synchronized with internal data output. Echo clocks run free during normal operation.

The Echo clock is triggered by internal output clock signal, and transferred to external through same structures as output driver.

### **Power-Up/Power-Down Supply Voltage Sequencing**

The following power-up supply voltage application is recommended: Vss, VDD, VDDQ, VREF, then VIN. VDD and VDDQ can be applied simultaneously, as long as VDDQ does not exceed VDD by more than 0.5V during power-up. The following power-down supply voltage removal sequence is recommended: VIN, VREF, VDDQ, VDD, Vss. VDD and VDDQ can be removed simultaneously, as long as VDDQ does not exceed VDD by more than 0.5V during power-down.

**Detail Specification of Power-Up Sequence in QDRII+ SRAM**

QDRII+ SRAMs must be powered up and initialized in a predefined manner to prevent undefined operations.

**• Power-Up Sequence**

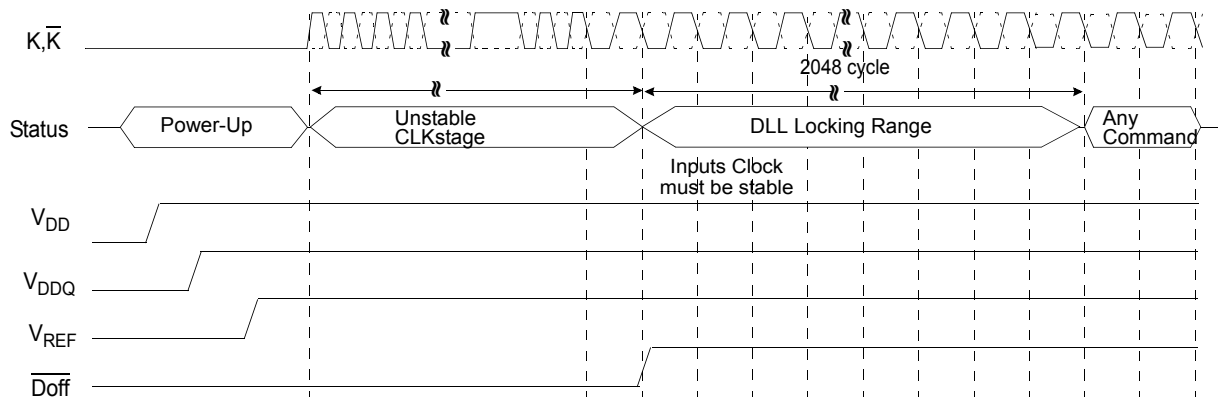

1. Apply power and keep  $\overline{\text{Doff}}$  at low state (All other inputs may be undefined)
  - Apply VDD before VDDQ
  - Apply VDDQ before VREF or the same time with VREF
2. Just after the stable power and clock(K, $\overline{\text{K}}$ ), take  $\overline{\text{Doff}}$  to be high.
3. The additional 2048 cycles of clock input is required to lock the DLL after enabling DLL

\* **Notes:** If you want to tie up the  $\overline{\text{Doff}}$  pin to High with unstable clock, then you must stop the clock for a few seconds (Min. 30ns) to reset the DLL after it become a stable clock status.

**• DLL Constraints**

1. DLL uses either K clock as its synchronizing input, the input should have low phase jitter which is specified as TK var.
2. The lower end of the frequency at which the DLL can operate is 120MHz.
3. If the incoming clock is unstable and the DLL is enabled, then the DLL may lock onto a wrong frequency and this may cause the failure in the initial stage.

**Power up & Initialization Sequence ( $\overline{\text{Doff}}$  pin controlled)**

**Power up & Initialization Sequence ( $\overline{\text{Doff}}$  pin Fixed high, Clock controlled)**

\* **Notes:** When the operating frequency is changed, DLL reset should be required again. After DLL reset again, the minimum 2048 cycles of clock input is needed to lock the DLL.

## TRUTH TABLES

### SYNCHRONOUS TRUTH TABLE

K	$\bar{R}$	$\bar{W}$	D				Q				OPERATION
			D(A1)	D(A2)	D(A3)	D(A4)	Q(A1)	Q(A2)	Q(A3)	Q(A4)	
Stopped	X	X	Previous state	Previous state	Previous state	Previous state	Previous state	Previous state	Previous state	Previous state	Clock Stop
$\uparrow$	H	H	X	X	X	X	High-Z	High-Z	High-Z	High-Z	No Operation
$\uparrow$	L <sup>4</sup>	X	X	X	X	X	Q <sub>OUT</sub> at K(t+2)	Q <sub>OUT</sub> at $\bar{K}$ (t+2)	Q <sub>OUT</sub> at K(t+3)	Q <sub>OUT</sub> at $\bar{K}$ (t+3)	Read
$\uparrow$	H <sup>5</sup>	L <sup>4</sup>	D <sub>in</sub> at K(t+1)	D <sub>in</sub> at $\bar{K}$ (t+1)	D <sub>in</sub> at K(t+2)	D <sub>in</sub> at $\bar{K}$ (t+2)	X	X	X	X	Write

Notes: 1. X means "Don't Care".

- The rising edge of clock is symbolized by ( $\uparrow$ ).
- Before enter into clock stop status, all pending read and write operations will be completed.
- This signal was HIGH on previous K clock rising edge. Initiating consecutive READ or WRITE operations on consecutive K clock rising edges is not permitted. The device will ignore the second request.
- If this signal was LOW to initiate the previous cycle, this signal becomes a don't care for this operation however it is strongly recommended that this signal is brought HIGH as shown in the truth table.

### WRITE TRUTH TABLE(x18)

K	$\bar{K}$	$\bar{BW}_0$	$\bar{BW}_1$	OPERATION
$\uparrow$		L	L	WRITE ALL BYTES (K $\uparrow$ )
	$\uparrow$	L	L	WRITE ALL BYTES ( $\bar{K}$ $\uparrow$ )
$\uparrow$		L	H	WRITE BYTE 0 (K $\uparrow$ )
	$\uparrow$	L	H	WRITE BYTE 0 ( $\bar{K}$ $\uparrow$ )
$\uparrow$		H	L	WRITE BYTE 1 (K $\uparrow$ )
	$\uparrow$	H	L	WRITE BYTE 1 ( $\bar{K}$ $\uparrow$ )
$\uparrow$		H	H	WRITE NOTHING (K $\uparrow$ )
	$\uparrow$	H	H	WRITE NOTHING ( $\bar{K}$ $\uparrow$ )

Notes: 1. X means "Don't Care".

- All inputs in this table must meet setup and hold time around the rising edge of input clock K or  $\bar{K}$  ( $\uparrow$ ).
- Assumes a WRITE cycle was initiated.

### WRITE TRUTH TABLE(x36)

K	$\bar{K}$	$\bar{BW}_0$	$\bar{BW}_1$	$\bar{BW}_2$	$\bar{BW}_3$	OPERATION
$\uparrow$		L	L	L	L	WRITE ALL BYTES (K $\uparrow$ )
	$\uparrow$	L	L	L	L	WRITE ALL BYTES ( $\bar{K}$ $\uparrow$ )

	$\uparrow$	L	H	H	H	WRITE BYTE 0 ( $\bar{K}$ $\uparrow$ )
$\uparrow$		H	L	H	H	WRITE BYTE 1 (K $\uparrow$ )
	$\uparrow$	H	L	H	H	WRITE BYTE 1 ( $\bar{K}$ $\uparrow$ )
$\uparrow$		H	H	L	L	WRITE BYTE 2 and BYTE 3 (K $\uparrow$ )
	$\uparrow$	H	H	L	L	WRITE BYTE 2 and BYTE 3 ( $\bar{K}$ $\uparrow$ )
$\uparrow$		H	H	H	H	WRITE NOTHING (K $\uparrow$ )
	$\uparrow$	H	H	H	H	WRITE NOTHING ( $\bar{K}$ $\uparrow$ )

Notes: 1. X means "Don't Care".

- All inputs in this table must meet setup and hold time around the rising edge of input clock K or  $\bar{K}$  ( $\uparrow$ ).
- Assumes a WRITE cycle was initiated.

**ABSOLUTE MAXIMUM RATINGS**

PARAMETER		SYMBOL	RATING	UNIT
Voltage on VDD Supply Relative to VSS		VDD	-0.5 to 2.9	V
Voltage on VDDQ Supply Relative to VSS		VDDQ	-0.5 to VDD	V
Voltage on Input Pin Relative to VSS		VIN	-0.5 to VDD+0.3	V
Storage Temperature		TSTG	-65 to 150	°C
Operating Temperature	Commercial / Industrial	TOPR	0 to 70 / -40 to 85	°C
Storage Temperature Range Under Bias		TBIAS	-10 to 85	°C

**Note:** 1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

**OPERATING CONDITIONS** ( $0^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$ )

PARAMETER	SYMBOL	MIN	TYP	MAX	UNIT
Supply Voltage	VDD	1.7	1.8	1.9	V
	VDDQ	1.4	1.5	1.6	V

Input High Voltage(DC) <sup>2,4</sup>	VIH(DC)	VREF + 0.1	-	VDDQ + 0.3	V
Input Low Voltage(AC) <sup>6,7</sup>	VIL(AC)	-	-	VREF - 0.2	V
Input High Voltage(AC) <sup>6,7</sup>	VIH(AC)	VREF + 0.2	-	-	V

- Note:** 1. VDDQ must not exceed VDD during normal operation.  
2. These are DC test criteria. DC design criteria is  $V_{REF} \pm 50\text{mV}$ . The AC  $V_{IH}/V_{IL}$  levels are defined separately for measuring timing parameters.  
3.  $V_{IL}(\text{Min})_{DC} = -0.3\text{V}$ ,  $V_{IL}(\text{Min})_{AC} = -1.5\text{V}$  (pulse width  $\leq 3\text{ns}$ ).  
4.  $V_{IH}(\text{Max})_{DC} = V_{DDQ} + 0.3\text{V}$ ,  $V_{IH}(\text{Max})_{AC} = V_{DDQ} + 0.85\text{V}$  (pulse width  $\leq 3\text{ns}$ ).  
5. Overshoot :  $V_{IH}(\text{AC}) \leq V_{DDQ} + 0.5\text{V}$  for  $t \leq 50\% t_{KHKH}(\text{MIN})$ .  
Undershoot:  $V_{IL}(\text{AC}) \leq V_{SS} - 0.5\text{V}$  for  $t \leq 50\% t_{KHKH}(\text{MIN})$ .  
6. This condition is for AC function test only, not for AC parameter test.  
7. To maintain a valid level, the transiting edge of the input must:  
a) Sustain a constant slew rate from the current AC level through the target AC level,  $V_{IL(AC)}$  or  $V_{IH(AC)}$   
b) Reach at least the target AC level  
c) After the AC target level is reached, continue to maintain at least the target DC level,  $V_{IL(DC)}$  or  $V_{IH(DC)}$

CQ, $\bar{C}Q$ High to QVLD Valid	t <sub>QVLD</sub>	-0.2	0.2	-0.2	0.2	-0.2	0.2	ns	
<b>Setup Times</b>									
Address valid to K rising edge	t <sub>AVKH</sub>	0.40		0.40		0.40		ns	
Control inputs valid to K rising edge	t <sub>IVKH</sub>	0.40		0.40		0.40		ns	2
Data-in valid to K, $\bar{K}$ rising edge	t <sub>DVKH</sub>	0.28		0.28		0.28		ns	
<b>Hold Times</b>									
K rising edge to address hold	t <sub>KHAX</sub>	0.40		0.40		0.40		ns	
K rising edge to control inputs hold	t <sub>KHIX</sub>	0.40		0.40		0.40		ns	
K, $\bar{K}$ rising edge to data-in hold	t <sub>KHDX</sub>	0.28		0.28		0.28		ns	

- Notes:**
- All address inputs must meet the specified setup and hold times for all latching clock edges.
  - Control singles are R, W.  
However BWx does not apply to this parameters. BWx signals obey the data setup and hold times.
  - To avoid bus contention, at a given voltage and temperature t<sub>KLZ</sub> is bigger than t<sub>KHZ</sub>.  
The specs as shown do not imply bus contention because t<sub>KLZ</sub> is a MIN parameter that is worst case at totally different test conditions (0°C, 1.9V) than t<sub>KHZ</sub>, which is a MAX parameter (worst case at 70°C, 1.7V).  
It is not possible for two SRAMs on the same board to be at such different voltage and temperature.
  - Clock phase jitter is the variance from clock rising edge to the next expected clock rising edge.
  - V<sub>DD</sub> slew rate must be less than 0.1V DC per 50 ns for DLL lock retention. DLL lock time begins once V<sub>DD</sub> and input clock are stable.
  - This parameter is extrapolated from the input timing parameters (t<sub>KH $\bar{K}$ H</sub> - 200ps where 200ps is the internal jitter.) This parameter is only guaranteed by design and not tested in production.

## 1Mx36 & 2Mx18 QDR™ II+ b4 SRAM

### THERMAL RESISTANCE

PRMETER	SYMBOL	TYP	Unit	NOTES
Junction to Ambient	$\theta_{JA}$	20.8	°C/W	
Junction to Case	$\theta_{JC}$	2.3	°C/W	
Junction to Pins	$\theta_{JB}$	4.3	°C/W	

**Note:** Junction temperature is a function of on-chip power dissipation, package thermal impedance, mounting site temperature and mounting site thermal impedance.  $T_J = T_A + P_D \times \theta_{JA}$

### PIN CAPACITANCE

PRMETER	SYMBOL	TESTCONDITION	TYP	MAX	Unit	NOTES
Address Control Input Capacitance	C <sub>IN</sub>	V <sub>IN</sub> =0V	3.5	4	pF	
Input and Output Capacitance	C <sub>OUT</sub>	V <sub>OUT</sub> =0V	4	5	pF	
Clock Capacitance	C <sub>CLK</sub>	-	3	4	pF	

**Note:** 1. Parameters are tested with R<sub>Q</sub>=250Ω and V<sub>DDQ</sub>=1.5V.  
2. Periodically sampled and not 100% tested.

### AC TEST CONDITIONS

Parameter	Symbol	Value	Unit
Core Power Supply Voltage	V <sub>DD</sub>	1.7~1.9	V
Output Power Supply Voltage	V <sub>DDQ</sub>	1.4~1.6	V
Input High/Low Level	V <sub>IH</sub> /V <sub>IL</sub>	1.25/0.25	V
Input Reference Level	V <sub>REF</sub>	0.75	V
Input Rise/Fall Time	T <sub>R</sub> /T <sub>F</sub>	0.3/0.3	ns
Output Timing Reference Level		V <sub>DDQ</sub> /2	V

**Note:** Parameters are tested with R<sub>Q</sub>=250Ω

## IEEE 1149.1 TEST ACCESS PORT AND BOUNDARY SCAN-JTAG

This part contains an IEEE standard 1149.1 Compatible Test Access Port(TAP). The package pads are monitored by the Serial Scan circuitry when in test mode. This is to support connectivity testing during manufacturing and system diagnostics. Internal data is not driven out of the SRAM under JTAG control. In conformance with IEEE 1149.1, the SRAM contains a TAP controller, Instruction Register, Bypass Register and ID register. The TAP controller has a standard 16-state machine that resets internally upon power-up, therefore, TRST signal is not required. It is possible to use this device without utilizing the TAP. To disable the TAP controller without interfacing with normal operation of the SRAM, TCK must be tied to V<sub>ss</sub> to preclude mid level input. TMS and TDI are designed so an undriven input will produce a response identical to the application of a logic 1, and may be left unconnected. But they may also be tied to V<sub>DD</sub> through a resistor. TDO should be left unconnected.

### JTAG Block Diagram

### JTAG Instruction Coding

IR2	IR1	IR0	Instruction	TDO Output	Notes
0	0	0	EXTEST	Boundary Scan Register	1
0	0	1	IDCODE	Identification Register	3
0	1	0	SAMPLE-Z	Boundary Scan Register	2
0	1	1	RESERVED	Do Not Use	6
1	0	0	SAMPLE	Boundary Scan Register	5
1	0	1	RESERVED	Do Not Use	6
1	1	0	RESERVED	Do Not Use	6
1	1	1	BYPASS	Bypass Register	4

**NOTE:**

1. Places DQs in Hi-Z in order to sample all input data regardless of other SRAM inputs. This instruction is not IEEE 1149.1 compliant.
2. Places DQs in Hi-Z in order to sample all input data regardless of other SRAM inputs.
3. TDI is sampled as an input to the first ID register to allow for the serial shift of the external TDI data.
4. Bypass register is initiated to V<sub>ss</sub> when BYPASS instruction is invoked. The Bypass Register also holds serially loaded TDI when exiting the Shift DR states.
5. SAMPLE instruction dose not places DQs in Hi-Z.
6. This instruction is reserved for future use.
