Description of I/O Pin

VCC (Pin1)

The main DC power supply of the module, the voltage should be kept between from 3.2V to 5.0V. **The Vcc ripple must be controlled under 50mV_{pp} (Typical: 3.3V)**

ENABLE (Pin2)

Keep open or pull high to Power ON. Pull low to shutdown the module.

Enable (High): $1.8V \leq V_{enable} \leq VCC$

Disable (Low): $0V \leq V_{enable} \leq 0.25V$

GND (Pin3)

Ground

VBACKUP (Pin4)

This is the power for GPS chipset to keep RTC running when main power is removed. The voltage should be kept between 2.0V~4.3V. **(Typical: 3.0V)**

The pin must be connected for normal operation.

3D-FIX (Pin5)

The 3D-FIX was assigned as fix flag output. If not used, keep floating.

„ Before 2D Fix

The pin should continuously output one-second high-level with one-second low-level signal.

„ After 2D or 3D Fix

The pin should continuously output low-level signal.

Manual Soldering:

Soldering iron:

Bit Temperature: Under 380°C

Time: Under 3 sec.

Notes:

1. Please do not directly touch the soldering pads on the surface of the PCB board, in order to prevent further oxidation
2. The solder paste must be defrosted to room temperature before use so it can return to its optimal working temperature. The time required for this procedure is unique and dependent on the properties of the solder paste used.
3. The steel plate must be properly assessed before and after use, so its measurement stays strictly within the specification set by SOP.
4. Please watch out for the spacing between soldering joint, as excess solder may cause electrical shortage
5. Please exercise with caution and do not use extensive amount of flux due to possible siphon effects on neighboring components, which may lead to electrical shortage.
6. Please do not use the heat gun for long periods of time when removing the shielding or inner components of the GPS module, as it is very likely to cause a shift to the inner components and will leads to electrical shortage.
